| Course ID: ÚMV/ | Course name: Algorithmic Game Theory |
|-----------------|--------------------------------------|
| dATH/14 | |

Course type, scope and the method: Course type: Lecture

Recommended course-load (hours):

Per week: 4 Per study period: 56

Course method: present

Number of credits: 7

Recommended semester/trimester of the course: 1., 2.., 3., 4..

Course level: III.

Prerequisities:

Conditions for course completion:

Learning outcomes:

Broader relation of game theory and other disciplines. Understanding of the difference between existential and constructive results in mathematics. Undestanding of a new complexity class.

Brief outline of the course:

The notion of Nash equilibrium in bimatrix games. Nash existence theorem for games with finite number of pure strategies. Lemke-Howson algorithm for computing Nash equilibrium. Some NP-complete problems connected with Nash equilibrium. The PPAD complexity class. Proof of PPAD completeness of NASH problem. Brouwers fixed point theorem and Sperner lemma.

Voting games - various voting systems and their shortcommings. Arrows theorem on dictators and Gibbart-Sattertwaithe theorem on election manipulability. Various forms of election manipulation and their complexity.

| Course ID: ÚMV/ | Course name: Risk and extreme value theory |
|-----------------|--|
| dTRH/10 | |

Course type, scope and the method: Course type: Lecture

Recommended course-load (hours):

Per week: 3 Per study period: 42

Course method: present

Number of credits: 8

Recommended semester/trimester of the course: 1., 3.

Course level: III.

Prerequisities:

Conditions for course completion:

Based on written tests and oral exam.

Learning outcomes:

To give theoretical knowledge in stochastic modelling of insurance risk process and the elements of ruin theory. To provide a grounding in extreme value theory with applications to insurance and finance.

Brief outline of the course:

Individual and collective risk models. Probability distributions of individual claims. Distribution of the total number and of the hight of aggregated claims. Compound distributions, their characteristics and moment generating functions. The risk process as special random process. Cramér- Lundberg model and its modification. Risk reserves and ruin probability approximations.

The elements of extreme value theory. Probability distributions of extremes, heavy-tailed, subexponential and stable distributions. The frequency of claim occurence and waiting times for extremes. Methods for registration of extremes. Limit distributions for block-maxima, excesses-over-threshold an records. Methods of statistical analysis of extremes.

Recommended literature:

| Learning outcomes: To make known special discrete and continuous stochastic processes and their applications to finance and insurance. | | | |
| Brief outline of the course: Point processes. Generalization of Poisson process and renewal process. Martingales with discrete and continuous time. Diffusion processes. Continuous Markov processes, Fokker-Planck differential equations for conditional densities. Gauss process, Wiener process and its modifications. The reflectional principle. Itô process with applications. | | | |
