Course shall introduce basic plant stress conditions to the students and elucidate phytohormonal regulation of specific plant defence mechanisms. Brief outline of the course: Causes, types and symptoms of stress. General mechanisms of stress reactions in living organisms. Plant stress reactions – synthesis of plant hormones (auxins, cytokinins, ethylene, jasmonic acid, salicylic acid, abscisic acid, NO and others), proteins, metabolites and other compounds related to stress response. Examples of known plant stress signalling cascades starting from signal perception, its processing and subsequent physiological changes leading to execution of growth and developmental reaction to the stress condition. Practicals (): cultivation of experimental plants under stress conditions, their analysis and evaluation of results. Recommended literature: Taiz L, Zeiger E, Plant physiology. 4th editon. oral examination

Learning outcomes:

The main goal of the subject is to get knowledge on the basic reasons of recent distribution of the animals on the Earth, zoogeographic regionalization of the Earth's surface and human influence on the faunal distribution in the history.

Brief outline of the course:

This course will review our current understanding of the patterns of animal distribution and the processes that influence distributions of species and their attributes. Zoogeography will integrate information on the historical and current ecology, genetics, and physiology of animals and their interaction with environmental processes (continental drift, climate) in regulating geographic distributions. The course will emphasize descriptive and analytical approaches useful in hypothesis testing in zoogeography and will illustrate applied aspects of zoogeography (e.g. refuge design in conservation).
