COURSE INFORMATION LETTER

University: P. J. Šafárik University in Košice

Faculty: Faculty of Science

Course ID: ÚFV/ POCF/13	Course name: Computational Physics

Course type, scope and the method:
Course type: Lecture   Recommended course-load (hours):   Per week: 4 Per study period: 56   Course method: present

Number of ECTS credits: 8

Recommended semester/trimester of the course: 2.

Course level: III.

Prerequisities:

Conditions for course completion: Examination

Learning outcomes: To acquaint students with modern methods of computational physics and their application to different physical systems.

Brief outline of the course:
Brief outline of the course: 1. Modern Monte Carlo methods targeted for problematic complex systems with multimodal energy surfaces. Multicanonical methods. Parallel tempering (replica exchange) method. Calculation of density of states and free energy by using Wang-Landau method.   2. Molecular Dynamics. Hybrid Monte Carlo method and spin dynamics. Langevin equations. Cellular automata of lattice gas. Quantum Monte Carlo simulations of lattice systems based on Suzuki-Trotter relation. Ising model in transversal field. Anisotropic Heisenberg chain. Monte Carlo Renormalization Group (MCRG) methods. Mao and Swendsen method. Problems of dynamics.   3. Other models and applications. Fitting data with linear models. Pattern recognition. Recurrent neural networks and time series prediction. Hebbian learning. Principal component analysis. Stochastic signal processing. Simulations of neural networks. Socio-physical models motivated by spin models. Galam models. Voter model in hierarchical systems. Model of group decision making. The opinion dynamics. Sznajd model and its applications.

 Course type:
 Recommended course-load (hours):
 Per week: Per study period:
 Course method: present

Number of ECTS credits: 20

Recommended semester/trimester of the course:

Course level: III.

Prerequisities:

Conditions for course completion:
 Obtaining required number of credits as given by the study plan.

Learning outcomes:
 Evaluation of competences of the student according to his/her scientific profile.

Brief outline of the course:
 Presentation of the results in the thesis for disertation exam, responding to referee´s comments, answering questions of exam committee. Two questions are selected subsequently from one compulsory and one optional subject, respectively. The subjects are selected by guarantee of the program according to the study plan and scientific profile of the student. The third question addresses the current state of work on dissertation thesis.

 Course method: present

Number of ECTS credits: 3

Recommended semester/trimester of the course: 2.

Course level: III.

Prerequisities:

Conditions for course completion:
 Distance mode of instruction. Online consultations.
 Test, oral exam in accordance with the exam requirements (https://www.upjs.sk/filozoficka-fakulta/cjp/doktorandi-upjs/)

Learning outcomes:
 Development of students´language skills, improvement of students´linguistic competencies (selected aspects of English pronunciation, vocabulary and syntax), development of students´s pragmatic competence (selected aspects of functional grammar) with focus on English for academic and specific purposes. B2/C1 level of lanugage competence (according to CEFR.)

Brief outline of the course:
 Specific aspecs of academic and professional English with focus on vocabulary development (noun and verb collocations, phrasal verbs, prepositional phrases, word-formation, formal/informal language, etc.), selected aspects of English grammar (prepositions, grammar tenses, passive voice, etc.), selected functional grammar (expressing opinion, cause/effect, arguments, examples, etc.). Academic communication. Cross-language interference.

COURSE INFORMATION LETTER

University: P. J. Šafárik University in Košice

Faculty: Faculty of Science

Course ID: ÚFV/ ERS/13	Course name: Exactly Solved Models in Statistical Physics

Course type, scope and the method:
Course type: Lecture
Recommended course-load (hours):
Per week: 4 Per study period: 56
Course method: present

Number of ECTS credits: 8

Recommended semester/trimester of the course: 4.

Course level: III.

Prerequisities:

Conditions for course completion:
Examination

Learning outcomes:
To become familiar with selected exactly solved models in statistical physics and to gain a deeper understanding of physical phenomena explained by these exactly solved models.

Brief outline of the course:
1. Exact solution for one-dimensional quantum Ising chain and quantum XY chain in a transverse magnetic field. Jordan-Wigner, Fourier and Bogoliubov transformations. Quantum critical points and anomalous behaviour of quantities in their close vicinity.
2. Exact solution for one-dimensional quantum Heisenberg chain within the framework of second-quantization formalism, the introduction to Bethe ansatz method. Elementary excitation spectrum, free and bound states of the Heisenberg model with two spin deviations.
3. Two-dimensional Ising model: dual transformation, star-triangle transformation, decoration-iteration transformation and theory of generalized algebraic transformations. Critical temperatures and universality in critical behaviour. The formulation of exact solution through the transfer-matrix method. Two-dimensional Ising model as model of binary alloys, and lattice model of liquid mixtures, Frenkel-Louis and Lin-Taylor model.
The selection from aforedescribed topics is made by the supervisor according to scientific orientation of the dissertation thesis.

Number of ECTS credits: 8

Recommended semester/trimester of the course: 1.

Course level: III.

Prerequisities:

Conditions for course completion:
 Examination

Learning outcomes:
 Improve the students in the use of mathematical methods in theoretical physics.

Brief outline of the course:
 1. Differential equations of mathematical physics. Generalized functions. Delta function. Differential calculus of generalized functions. Fourier series of delta functions. Green's function for one-dimensional boundary value problems. Green's function for
 Poisson's equation. Differential calculus in the plane. Two-dimensional delta function.
 2. Complex analysis. Complex functions. Complex differentiation. Power series and analyticity. Harmonic functions. Applications in fluid mechanics. Complex integration. Cauchy theorem. Cauchy integral formula. Differentiation through integration. Analytical continuation to the plane and space.
 3. Conformal mapping. Analytical maps. Conformality. Composition and Riemann mapping theorem. Anular domain. Applications of conformal mapping. Applications of harmonic functions and Laplace's equation. Applications in fluid flow. Poisson's equation and Green's function. Transformations and convolution.

Learning outcomes:
To become familiar with mathematical methods, which enable to solve the problem of particle transport in an inhomogeneous medium (interplanetary space).

Brief outline of the course:
Basic notions in plasma physics. Energetic particles in a proximity universe and the structure of heliosphere. Liouville equation as a basis for description of the kinetics of neutral and charged particles. Boltzmann equation and its application by solving the problem of a particle transport with low collision frequencies. Application of Vlasov equation for solving the problem of particle transport in a plasma. Introduction to hydrodynamics and magnetohydrodynamics. Small-angle scattering approximation, Fokker-Planck equation. The passive advection of high-energy charged particles in a turbulent magnetic field. The diffusion approximation and basic solutions of diffusion equations in an inhomogeneous stochastic environment. Application of the solutions of diffusion equations for a description of the transport of charged particles in a plasma.
The selection from aforedescribed topics is made by the supervisor according to scientific orientation of the dissertation thesis.

Course type, scope and the method: **Course type:** Lecture **Recommended course-load (hours):** **Per week: Per study period:** 28s **Course method:** present

Number of ECTS credits: 5

Recommended semester/trimester of the course:

Course level: III.

Prerequisities:

Conditions for course completion: Case study, micro-output, its analysis Current modifications of the course for the semester 2020/2021 are listed in the electronic bulletin board of the course.

Learning outcomes: Acquisition of psychological skills necessary for professional, competent performance of university teaching practice of doctoral students on the basis of acquisition and use of selected psychological knowledge from cognitive psychology, psychology of emotions and motivation, personality psychology, developmental, social, pedagogical psychology and health psychology. They will enable university teachers - doctoral students to understand the psychological interpretation of human development, upbringing and education. The acquired knowledge will enable better application in practice, are closely linked to practice and are based on current knowledge of the field.

Brief outline of the course: University teacher and his work in the teaching process with a focus on: teacher in relation to himself (cognitive, personality, social competencies and competencies in the use of methods), in relation to students and as part of the teacher-student relationship based on selected areas of cognitive psychology, psychology of emotions and motivation, developmental psychology, social psychology , educational psychology and health psychology with application to the university environment.

University: P. J. Šafárik University in Košice

Faculty: Faculty of Science

Course ID: ÚFV/ KTP/13	**Course name:** Quantum Field Theory

Course type, scope and the method:
 Course type: Lecture
 Recommended course-load (hours):
 Per week: 4 **Per study period:** 56
 Course method: present

Number of ECTS credits: 8

Recommended semester/trimester of the course: 2.

Course level: III.

Prerequisities:

Conditions for course completion:
 Examination

Learning outcomes:
 To acquaint with quantum field theory methods and their application in theory of elementary particles and statistical physics.

Brief outline of the course:
 1. Quantum field, Lagrange formalism, interacting quantum fields, Wick theorems and Feynman diagrammatic technique, higher orders of perturbation theory.
 2. Application of quantum field theory in the theory of elementary particles: standard model, unified theories of elementary particles.
 3. Application of quantum field theory in statistical physics. Feynman diagrams.
 4. Critical dynamics and description of scaling at phase transitions by means of quantum-field technique and renormalization group.
 Selection of aforementioned topics will be made by supervisor according to the content and aims of PhD thesis

Recommended literature:
 1. L.H. Ryder, Quantum Field Theory, Cambridge University Press, Cambridge, 1996.
 2.A. Zee, Quantum Field Theory in Nutshell, Princeton University Press, Princeton, 2010.
 3. P. Ramond, Field Theory: A Modern Primer, Westview Press, 1990.

Course ID: ÚFV/ KTMS/04	Course name: Quantum Theory of Many-Body Systems

Course type, scope and the method:
 Course type: Lecture
 Recommended course-load (hours):
 Per week: 4 Per study period: 56
 Course method: present

Number of ECTS credits: 8

Recommended semester/trimester of the course: 3.

Course level: III.

Prerequisities:

Conditions for course completion:
 Examination

Learning outcomes:

Brief outline of the course:
1. Quantum theory of magnetism. Ferromagnetic, ferrimagnetic and antiferromagnetic quantum many-body systems. Theoretical model of quantum magnetism - Heisenberg, XY and Hubbard model. Second quantization, Jordan-Wigner, Bogolubov and Dyson-Maleeev transformation, density matrix renormalization group.
2. Green functions. Spectral representation of Green functions. Green functions in the theory of non-linear processes. Applications of the Green functions in solid state physics. Density states, Kubo-Greenwood formula. Theory of superconductivity.
3. Non-linear equations in mathematical physics: Korteweg-de Vries quation, solitons, non-linear Schrodinger equation, sin-Gordon equation. Applications of non-linear equations in physics: Josephson effect, domain wall, theory of dislocation.

Recommended literature:

COURSE INFORMATION LETTER

University: P. J. Šafárik University in Košice	

Faculty: Faculty of Science

Course ID: ÚFV/ SAVKSM/13	**Course name:** Quantum-Statistical Methods for Strongly-Correlated Systems

Course type, scope and the method:
 Course type: Lecture
 Recommended course-load (hours):
 Per week: 4 **Per study period:** 56
 Course method: present

Number of ECTS credits: 8

Recommended semester/trimester of the course: 2.

Course level: III.

Prerequisities:

Conditions for course completion:
 Examination

Learning outcomes:
 To improve student knowledge for employing analytical and numerical methods in the theory of many-particle systems.

Brief outline of the course:
 Introduction to microscopic models of strongly correlated many-particle systems and their basic properties. Terminology, second quantization, fermions, bosons.
 Analytical methods: method of canonical transformations, Bogoliubov transformation, perturbation theory, variational principle. Exact solution for Hubbard and Anderson model, Bethe ansatz method. Green function method, Heisenberg, Schrödinger, iteration reprezentation, S-matrix, Wick theorem, Feynman's diagrams.
 Numerical methods: exact diagonalization, Lanczos algorithm, modified Lanczos method, variational Monte Carlo technique, density matrix renormalization group.
 The selection from aforedescribed topics is made by the supervisor according to scientific orientation of the dissertation thesis.

Course level: III.

Prerequisities:

Conditions for course completion:
 Examination

Learning outcomes:
 To acquaint students with a modern theory of phase transitions, nonequilibrium thermodynamics and modern statistical physics of macromolecules.

Brief outline of the course:
 1. Phase transitions and critical phenomena. Critical indices. Universality. Static scaling hypothesis. Kadanoff block spins. Theory of the renormalization group. Phase diagrams and fixed points. The perturbative renormalization group. Random systems.
 2. Nonequilibrium statistical thermodynamics. Equilibrium and nonequilibrium processes. Linear nonequilibrium thermodynamics. Phenomenological equations and Onsager relations. Fluctuation dissipation theorem. Kinetic theory. Master equation, Boltzmann equation, Langevin equation and Fokker-Planck equation.
 3. Statistical physics of macromolecules. Thermodynamics properties of polymer solutions and mixtures. Polymer gels. Molecular motion of the polymeric systems
 Selection from this topics makes supervisor depending on the scope of the dissertation.
