University: P. J. Šafárik University in Košice

Faculty: Faculty of Science

Course ID: ÚFV/ | **Course name:** Computational Physics

POCF/13

Course type, scope and the method:

Course type: Lecture

Recommended course-load (hours): Per week: 4 Per study period: 56

Course method: present

Number of ECTS credits: 8

Recommended semester/trimester of the course: 2.

Course level: III.

Prerequisities:

Conditions for course completion:

Examination

Learning outcomes:

To acquaint students with modern methods of computational physics and their application to different physical systems.

Brief outline of the course:

Brief outline of the course:

- 1. Modern Monte Carlo methods targeted for problematic complex systems with multimodal energy surfaces. Multicanonical methods. Parallel tempering (replica exchange) method. Calculation of density of states and free energy by using Wang-Landau method.
- 2. Molecular Dynamics. Hybrid Monte Carlo method and spin dynamics. Langevin equations. Cellular automata of lattice gas. Quantum Monte Carlo simulations of lattice systems based on Suzuki-Trotter relation. Ising model in transversal field. Anisotropic Heisenberg chain. Monte Carlo Renormalization Group (MCRG) methods. Mao and Swendsen method. Problems of dynamics.
- 3. Other models and applications. Fitting data with linear models. Pattern recognition. Recurrent neural networks and time series prediction. Hebbian learning. Principal component analysis. Stochastic signal processing. Simulations of neural networks. Socio-physical models motivated by spin models. Galam models. Voter model in hierarchical systems. Model of group decision making. The opinion dynamics. Sznajd model and its applications.

Recommended course-load (hours): Per week: 2 Per study period: 28

Course method: present

Number of ECTS credits: 3

Recommended semester/trimester of the course: 2.

Course level: III.

Prerequisities:

Conditions for course completion:

Distance mode of instruction. Online consultations.

Test, oral exam in accordance with the exam requirements (https://www.upjs.sk/filozoficka-fakulta/cjp/doktorandi-upjs/)

Learning outcomes:

Development of students' language skills, improvement of students' linguistic competencies (selected aspects of English pronunciation, vocabulary and syntax), development of students's pragmatic competence (selected aspects of functional grammar) with focus on English for academic and specific purposes. B2/C1 level of lanuage competence (according to CEFR.)

Brief outline of the course:

Specific aspecs of academic and professional English with focus on vocabulary development (noun and verb collocations, phrasal verbs, prepositional phrases, word-formation, formal/informal language, etc.), selected aspects of English grammar (prepositions, grammar tenses, passive voice, etc.), selected functional grammar (expressing opinion, cause/effect, arguments, examples, etc.). Academic communication. Cross-language interference.

Course ID: ÚFV/ | Course name: Exactly Solved Models in Statistical Physics

ERS/13

Course type, scope and the method:

Course type: Lecture

Recommended course-load (hours): Per week: 4 Per study period: 56

Course method: present

Number of ECTS credits: 8

Recommended semester/trimester of the course: 4.

Course level: III.

Prerequisities:

Conditions for course completion:

Examination

Learning outcomes:

To become familiar with selected exactly solved models in statistical physics and to gain a deeper understanding of physical phenomena explained by these exactly solved models.

Brief outline of the course:

- 1. Exact solution for one-dimensional quantum Ising chain and quantum XY chain in a transverse magnetic field. Jordan-Wigner, Fourier and Bogoliubov transformations. Quantum critical points and anomalous behaviour of quantities in their close vicinity.
- 2. Exact solution for one-dimensional quantum Heisenberg chain within the framework of second-quantization formalism, the introduction to Bethe ansatz method. Elementary excitation spectrum, free and bound states of the Heisenberg model with two spin deviations.
- 3. Two-dimensional Ising model: dual transformation, star-triangle transformation, decoration-iteration transformation and theory of generalized algebraic transformations. Critical temperatures and universality in critical behaviour. The formulation of exact solution through the transfer-matrix method. Two-dimensional Ising model as model of binary alloys, and lattice model of liquid mixtures, Frenkel-Louis and Lin-Taylor model.

The selection from aforedescribed topics is made by the supervisor according to scientific orientation of the dissertation thesis.

University: P. J. Šafárik University in Košice

Faculty: Faculty of Science

Course ID: ÚFV/ | Course name: Mathematical Methods in Theoretical Physics

MMTF/13

Course type, scope and the method:

Course type: Lecture

Recommended course-load (hours): Per week: 4 Per study period: 56

Course method: present

Number of ECTS credits: 8

Recommended semester/trimester of the course: 1.

Course level: III.

Prerequisities:

Conditions for course completion:

Examination

Learning outcomes:

Improve the students in the use of mathematical methods in theoretical physics.

Brief outline of the course:

1. Differential equations of mathematical physics. Generalized functions. Delta function. Differential calculus of generalized functions. Fourier series of delta functions. Green's function for one-dimensional boundary value problems. Green's function for

Poisson's equation. Differential calculus in the plane. Two-dimensional delta function.

- 2. Complex analysis. Complex functions. Complex differentiation. Power series and analyticity. Harmonic functions. Applications in fluid mechanics. Complex integration. Cauchy theorem. Cauchy integral formula. Differentiation through integration. Analytical continuation to the plane and space.
- 3. Conformal mapping. Analytical maps. Conformality. Composition and Riemann mapping theorem. Anular domain. Applications of conformal mapping. Applications of harmonic functions and Laplace's equation. Applications in fluid flow. Poisson's equation and Green's function. Transformations and convolution.

SAVKSM/13 Systems

Course type, scope and the method:

Course type: Lecture

Recommended course-load (hours): Per week: 4 Per study period: 56

Course method: present

Number of ECTS credits: 8

Recommended semester/trimester of the course: 2.

Course level: III.

Prerequisities:

Conditions for course completion:

Examination

Learning outcomes:

To improve student knowledge for employing analytical and numerical methods in the theory of many-particle systems.

Brief outline of the course:

Introduction to microscopic models of strongly correlated many-particle systems and their basic properties. Terminology, second quantization, fermions, bosons.

Analytical methods: method of canonical transformations, Bogoliubov transformation, perturbation theory, variational principle. Exact solution for Hubbard and Anderson model, Bethe ansatz method. Green function method, Heisenberg, Schrödinger, iteration reprezentation, S-matrix, Wick theorem, Feynman's diagrams.

Numerical methods: exact diagonalization, Lanczos algorithm, modified Lanczos method, variational Monte Carlo technique, density matrix renormalization group.

The selection from aforedescribed topics is made by the supervisor according to scientific orientation of the dissertation thesis.

Course level: III.

Prerequisities:

Conditions for course completion:

Examination

Learning outcomes:

To acquaint students with a modern theory of phase transitions, nonequilibrium thermodynamics and modern statistical physics of macromolecules.

Brief outline of the course:

- 1. Phase transitions and critical phenomena. Critical indices. Universality. Static scaling hypothesis. Kadanoff block spins. Theory of the renormalization group. Phase diagrams and fixed points. The perturbative renormalization group. Random systems.
- 2. Nonequilibrium statistical thermodynamics. Equilibrium and nonequilibrium processes. Linear nonequilibrium thermodynamics. Phenomenological equations and Onsager relations. Fluctuation dissipation theorem. Kinetic theory. Master equation, Boltzmann equation, Langevin equation and Fokker-Planck equation.
- 3. Statistical physics of macromolecules. Thermodynamics properties of polymer solutions and mixtures. Polymer gels. Molecular motion of the polymeric systems

 Selection from this topics makes supervisor depending on the scope of the dissertation.
