COURSE INFORMATION LETTER

University: P. J. Šafárik University in Košice

Faculty: Faculty of Science

Course ID: ÚFV/ POCF/13	**Course name:** Computational Physics

Course type, scope and the method:
Course type: Lecture
Recommended course-load (hours):
Per week: 4 **Per study period:** 56
Course method: present

Number of ECTS credits: 8

Recommended semester/trimester of the course: 2.

Course level: III.

Prerequisities:

Conditions for course completion:
To successfully complete the course, it is necessary for the student to demonstrate a sufficient degree of understanding of the principles of selected advanced computational methods. Lectures are organized in blocks, with a selection of topics reflecting the needs of currently registered students. The course ends with a final oral exam, the completion of which is conditioned by the submission of the project electronically and with the attached computer program. The credit evaluation of the course takes into account the following student workload: direct teaching (2 credits), self-study (2 credits), project work (2 credits), individual consultations (1 credit), and exam (1 credit). The minimum limit for completing the course is to obtain at least 50% of the total score.

Learning outcomes:
To acquaint students with modern methods of computational physics and their application to various physical and non-physical systems. Students have the opportunity to get acquainted with modern Monte Carlo methods and methods of molecular dynamics, developed for demanding simulations of complex systems using parallel programming, as well as their various interdisciplinary applications.

Brief outline of the course:
1. Modern Monte Carlo methods for application to problematic complex systems with rugged energy surfaces. Multicanonical methods. Parallel tempering method (replica exchange). Calculation of density of states and free energy using the Wang-Landau method. Massively parallelized Wang-Landau replica exchange method for petaflop supercomputers.
2. Molecular Dynamics. Advanced concepts of computer simulation techniques used in statistical physics and their importance for understanding physical systems. Approach of molecular dynamics and its application in problems of statistical physics. Cellular automata for lattice gas. Problems of dynamics.
3. Other models and applications. Sociophysical models based on spin models. Galam's models. Voting model in hierarchical systems. Group decision model. Dynamics of opinion formation. Sznajd's model and its applications. Applications of statistical physics approaches in modeling spatio-temporal data. Time series predictions and digital image processing. Geostatistical applications.

COURSE INFORMATION LETTER

University: P. J. Šafárik University in Košice

Faculty: Faculty of Science

Course ID: ÚFV/ODZP/14	**Course name:** Defence of Doctoral Thesis

Course type, scope and the method:
Course type:
Recommended course-load (hours):
Per week: Per study period:
Course method: present

Number of ECTS credits: 30

Recommended semester/trimester of the course:

Course level: III.

Prerequisities:

Conditions for course completion:
The Dissertation thesis is the result of the student's own scientific research. It must not show elements of academic fraud and must meet the criteria of correct research practice defined in the Rector's Decision no. 21/2021, which lays down the rules for assessing plagiarism at Pavel Jozef Šafárik University in Košice and its constituents. Fulfillment of the criteria is verified mainly in the process of supervising and in the process of the thesis defense. Failure to do so is grounds for disciplinary action.

Learning outcomes:
The Dissertation thesis has elements of a scientific work and the student demonstrates extensive mastery of the theory and professional terminology of the field of study, acquisition of knowledge, skills and competences in accordance with the declared profile of the graduate of the field of study, as well as the ability to apply them in an original way in solving selected problems of the field of study. The student demonstrates the ability of independent scientific work in terms of content, formal and ethical aspects. Further details of the Dissertation thesis are determined by Directive no. 1/2011 on the essential prerequisites of final theses and by the Study Rules of Procedure at UPJŠ in Košice for doctoral studies.
The doctoral student demonstrated the ability and readiness for independent scientific and creative activity in the field of study of philology in accordance with the expectations of the relevant qualification framework and the profile of the graduate.

COURSE INFORMATION LETTER

University: P. J. Šafárik University in Košice	
Faculty: Faculty of Science	
Course ID: ÚFV/ MDU/04	**Course name:** Detection Methods and Experiments on Large Colliders

Course type, scope and the method:
Course type: Lecture
Recommended course-load (hours):
Per week: 2 **Per study period:** 28
Course method: present

Number of ECTS credits: 4

Recommended semester/trimester of the course: 2.

Course level: III.

Prerequisities:

Conditions for course completion:
Conditions for continuous evaluation:
1. Presence at the lectures as specified by the rules of study and indicated by the lecturer.
2. Activity at seminars.
Conditions for the final evaluation:Research work on a selected topic.
Conditions for the successful course completion:
1. Active presence at lectures.
2. Fulfillment of the conditions of continuous and final evaluation at more than 90% level.
Credit evaluation of the course: direct teaching, individual consultations, self-study (1 credit), practical activities – research work (2 credits), evaluation (1 credit).

Learning outcomes:
The student can demonstrate sufficient knowledge about the physics principles and measurement methods in the high energy and particle physics in large experiments with particle accelerators. Aqcuired knowledge can be actively used during the physics analysis of the real experimental data.

Brief outline of the course:
1. Passage of radiation through matter.
2. Gaseous detectors: principles of operation, ionization chamber, proportional chamber, spark chamber, streamer chamber, MWPC, drift chamber, TPC.
3. Scintillation detectors: Geiger and Marsden experiments, scintillation detectors, photomultipliers.
4. Calorimeters: calorimetry in the high energy physics, electromagnetic calorimeters, Rossi-Heitler model of the electromagnetic shower, electromagnetic showers, practical realization of electromagnetic calorimeters, energetic resolution of electromagnetic calorimeters.
5. Hadron calorimeters: hadron showers, electromagnetic and hadronic shower components, calorimeter response, compensation, energy resolution.
6. Cherenkov radiation detectors: Cherenkov radiation, differential Ch. detectors, RICH.
7. Transition radiation detectors.
8. Semiconductor detectors: conduction, semiconductors, P-N junction, microstrip detectors, pixel detectors, drift detectors.
9. Time of flight method.

10. Muon detectors: multiple scattering, Branson plane.
11. Photoemulsion detectors.
12. Experiments at large accelerators. ALICE experiment at LHC at CERN.

Number of ECTS credits: 20

Recommended semester/trimester of the course:

Course level: III.

Prerequisities:

Conditions for course completion:
Obtaining required number of credits as given by the study plan.

Learning outcomes:
Evaluation of competences of the student according to his/her scientific profile.

Brief outline of the course:
Presentation of the results in the thesis for disertation exam, responding to referee´s comments, answering questions of exam committee. Two questions are selected subsequently from one compulsory and one optional subject, respectively. The subjects are selected by guarantee of the program according to the study plan and scientific profile of the student. The third question addresses the current state of work on dissertation thesis.

Term project, evaluation.
Credit evaluation of the course: direct teaching, individual consultations and self-study (1 credit), practical activities – term project (2 credits), evaluation (1 credit). Minimum limit for completion of the course is to obtain at least 51% of the total evaluation.

Learning outcomes:
Lectures on parallel data processing on analysis farms.

Brief outline of the course:
Introduction to batch systems and network storage.
Generate multiple events using event generator and run multiple simulations on cluster.
Analyze these data to produce physics results.
Merge these results when analysis is done.

Conditions for course completion:
Literature search and compilation on one particular subject selected. Concluding work.
Credit evaluation of the course: direct teaching,
individual consultations and self-study (1 credit), practical activities – concluding work (2 credits), evaluation (1 credit).

Learning outcomes:
To acquaint with the know edge of selected physical processes in the inner and outer heliosphere.

Brief outline of the course:
1. Introduction. Radial structure of the Sun. 2. Sun atmosphere. Solar flares. Acceleration of particles in eruptions. Solar neutrons and gamma radiation. 3. Solar wind. Interplanetary magnetic field. Corotion interaction areas. 4. Plasma waves in the interplanetary environment. Three-dimensional structure of the heliosphere. 5. Active processes in the Sun. Eruptions and outbursts of coronal matter. Shock waves. 6. Solar radio emissions. Thermal emission. Microwave domain. Radio emissions after eruptions and disturbances in the interplanetary environment. 7. Energy particles in the heliosphere. Populations and resources. Solar energy particles. 8. Transport of particles in the interplanetary field. Theoretical foundations. Spatial diffusion. Diffusion in the space of pitch angles. Diffusion in the space of momentum. 9. Interactions of waves and particles in the heliosphere. Transport equations. 10. Observations of particle propagation in the interplanetary environment. Comparison with experiment. 11. Acceleration of particles on shock waves - theoretical models. 12. Particles on shock waves in the interplanetary environment. 13. Galactic cosmic rays and modulation models.

Prerequisities:

Conditions for course completion:
Completion of e-course English for PhD Students (lms.upjs.sk), consultations (1-3).
Written assignments - Professional/Academic CV, Short Academic Biography.

Learning outcomes:
The development of students´ language skills - reading, writing, listening, speaking, improvement of their linguistic competence - students acquire knowledge of selected phonological, lexical and syntactic aspects, development of pragmatic competence - students can efectively use the language for a given purpose, with focus on Academic English and English for specific/professional purposes, level B2.

Brief outline of the course:
Specific aspects of academic and professional English with focus on correct pronunciation, vocabulary development (noun and verb collocations, phrasal verbs, prepositional phrases, word-formation, formal/informal language, etc.), selected aspects of English grammar (prepositions, grammar tenses, passive voice, etc.), academic writing (professional/academic CV, Short Academic Biography).

Prerequisities:	
Conditions for course completion: Test, oral exam in accordance with the exam requirements (https://www.upjs.sk/filozoficka-fakulta/cjp/doktorandi-upjs/)	
Learning outcomes: The development of students´ language skills - reading, writing, listening, speaking, improvement of their linguistic competence - students acquire knowledge of selected phonological, lexical and syntactic aspects, development of pragmatic competence - students can efectively use the language for a given purpose, with focus on Academic English and English for specific/professional purposes, level B2.	
Brief outline of the course: Academic communication (self-presentation, presenting at scientific meetings and conferences). Specific aspects of academic and professional English with focus on vocabulary development (formality, academic word-list), English grammar (passive voice, nominalisatio), language functions (expressing opinion, cause/effect, presenting arguments, giving examples, describing graphs/charts/schemes, etc.). Cross-language interference.

COURSE INFORMATION LETTER

University: P. J. Šafárik University in Košice	
Faculty: Faculty of Science	
Course ID: ÚFV/ ESH/09	**Course name:** Extremal States of Matter

Course type, scope and the method:
Course type: Lecture
Recommended course-load (hours):
Per week: 2 **Per study period:** 28
Course method: present

Number of ECTS credits: 4

Recommended semester/trimester of the course: 2.

Course level: III.

Prerequisities:

Conditions for course completion:
Literature search and compilation on one particular subject selected. Concluding work.
The credit evaluation of the course: direct teaching, individual consultations and self-study (1 credit), practical activities – concluding work (2 credits), evaluation (1 credit).

Learning outcomes:
The main goal of lectures is introduction to matter extremal states topic.

Brief outline of the course:
1. Inroduction to basic
2. Plasma
3. Quark-hadrons phase transition
4. Short introduction to modern cosmology
5. Space expansion
6. Simple cosmological models
7. Big hot explosion
8. Phase transitions in early space
9. Elements nucleosynthesis and origin of light elements
10. Compact stars
11. Dark matter, dark energy
12. Inflation space

University: P. J. Šafárik University in Košice

Faculty: Faculty of Science

Course ID: ÚFV/ UFRJZ/09	**Course name:** Introduction to Physics of Relativistic Nuclear Collisions

Course type, scope and the method:
Course type: Lecture
Recommended course-load (hours):
Per week: 2 **Per study period:** 28
Course method: present

Number of ECTS credits: 5

Recommended semester/trimester of the course: 2.

Course level: III.

Prerequisities:

Conditions for course completion:
written test and thesis, exam

Learning outcomes:
Acquisition of basic knowledges from the high-energy heavy ion physics.

Brief outline of the course:
Heavy ion collisions from intermediate to ultra-relativistic energies are covered in this lecture. After the introductory part, including kinematics, cross sections, geometry and centrality of nuclear collisions, the fragmentation processes, multiplicities, longitudinal and transverse momentum spectra of secondary particles are discussed. The next part covers a wide range of subjects from strangeness production and heavy flavors through creation of antinuclei and hypernuclei in nuclear collisions to hadron femtoscopy. Some selected phenomena connected with possible production of the dense and hot nuclear matter (quark-gluon plasma) are introduced. Finally, collective flows, charmonium suppression, di-lepton mass spectra, direct photons and production of particles with high transverse momenta are presented.
1. Introduction
2. Basic overview of the phenomenology of heavy ion collisions
3. Introduction to relativistic kinetic theory
4. Relativistic Boltzmann transport equation
5. Equation of state
6. Relativistic fluid dynamics
7. Simple models
8. Measurable quantities
9. Scaling in hydrodynamic model
10. Direct solution of the kinetic equation
11. Search for quark-gluon plasma
12. Relation to astrophysics

Recommended literature:

Recommended course-load (hours):
Per week: 2 **Per study period:** 28
Course method: present

Number of ECTS credits: 4

Recommended semester/trimester of the course: 2.

Course level: III.

Prerequisities:

Conditions for course completion:
Knowledge of the subject at a sufficient level, evaluation. The credit evaluation of the course takes into account the following student workload: direct teaching (1 credit), self-study (2 credits) and evaluation (1 credit).

Learning outcomes:
Special lectures oriented towards particle calorimetry.

Brief outline of the course:
Interactions of particles with matter:
electrons, protons, charged particles, photons, muons.
Energy loss, range.
Interactions at high energy.
Calorimeters:
Principles of Calorimetry.
Electromagnetic and Hadronic Showers.
Shower Profiles and Containment.
Electromagnetic calorimeters.
Hadronic calorimeters.
Free electron drift velocities in liquid ionization chamber.
Types of Calorimeters:
Compensating and non-compensating.
Total Absorption, Sampling, homogeneous
Scintillation, Ionization, Cherenkov.
Signal Detection.
Shower shapes in hadron calorimeters.
Fluctuations in hadronic energy measurements.
Position resolution in the calorimeters.
Shower maximum detectors.
Signal read-out, processing, calibration of readout electronics. Physics calibration of electromagnetic and hadron calorimeters, jet reconstruction, determination of missing energy and that of the jet energy scale. (Getting from calorimetry to physics results).

Energy and position resolution in calorimetry.

Course type, scope and the method:
Course type: Lecture
Recommended course-load (hours):
Per week: 2 **Per study period:** 28
Course method: present

Number of ECTS credits: 5

Recommended semester/trimester of the course: 1.

Course level: III.

Prerequisities:

Conditions for course completion:
Knowledge of the subject at a sufficient level, exam. The credit evaluation of the course takes into account the following student workload: direct teaching (2 credits), self-study (2 credits) and evaluation (1 credit).

Learning outcomes:
Lectures are oriented on explanation of the strong interaction on the base of first principles, their description and analysis of both elastic and deep-inelastic scattering of hadrons and leptons. Determination of the color is introduced, which is basic quantum number for strongly interacting particles and fundamental physical principle on which quantum chromodynamics (QCD) is constructed. Basic features of this theory are explaned and it is demonstrated its application for calculation cross sections of typical interacting processes in presence of mesons and baryons.

Brief outline of the course:
1. The concept of color as the basic quantum number of hadrons and the basic principle for formulating a fundamental theory for strongly interacting particles.
2. Color special unitary calibration group SUc (3).
3. Quarks and gluons as SUc multiplets (3).
4. Partons, cross sections, formfactors (basic knowledge).
5. Deep-elastic scattering of electrons on a proton. Neutrino scattering on a nucleon. Summation rules.
6. Additive parton model.
7. The concept of structural function. Bjorken scaling.
8. Quantum chromodynamics as a theory of strong interactions and its Lagrangian.
9. Feynman graphs in momentum representation.
10. Binding constant for QCD and asymptotic freedom.
11. Confinement of quarks and gluons.
12. QCD within the standard model.

COURSE INFORMATION LETTER

University: P. J. Šafárik University in Košice	
Faculty: Faculty of Science	
Course ID: ÚFV/ VKJSF/04	**Course name:** Selected Topics from Nuclear and Subnuclear Physics

Course type, scope and the method:
Course type: Lecture
Recommended course-load (hours):
Per week: 4 **Per study period:** 56
Course method: present

Number of ECTS credits: 10

Recommended semester/trimester of the course: 1.

Course level: III.

Prerequisities:

Conditions for course completion:
preparation of a paper draft using several selected key publications
Credit distribution:
lectures + consulting: 37 hours - 2 credits
preparation the paper draft + study: 95 hours - 5 credits
writing the paper draft: 56 hours - 3 credit

Learning outcomes:
Gain knowledge on the heavy ion experimental programme at CERN SPS accelerator leading to the discovery of the kvark-gluon plasma. Gain knowledge on heavy-ion programme at RHIC collider at BNL and at CERN LHC.

Brief outline of the course:
I. block (1.-6. week):
1. Ultrarelativistic heavy ion collisions. Introduction. Discovery of QGP.
2. SPS accelarator, heavy ion beams and the key experiments at CERN.
3. NA44 experiment.
4. NA45 experiment.
5. NA49 experiment.
6. NA50 experiment.
7. WA97 and NA57 experiments.
8. WA98 experiment.
9. Ingredients of the CERN QGP.
10. Claim of discovery.
II. block (7.-12. week):
1. Experiment STAR at RHIC.
2. Discovery of Ridge structure.
3. Indication of Mach cone.
4. Elliptical flow at RHIC.
5. Jet quenching.
6. QGP signatures at CERN LHC.
7. Possible signatures in small systems at ALICE experiment.

Applied, medical physics:
General part: Rutherford scattering, nuclear phenomenology, nuclear models, nuclear radiation, use of nuclear physics, energy losses in matter, particle detection, accelerators, elementary particle properties, symmetry, discrete transformations, neutral kaons, oscillations and CP violation, Standard model.
Special part: Nuclear reactions, biological effects of radiation, industrial and analytical applications, nuclear medicine.

Recommended literature:

COURSE INFORMATION LETTER

University: P. J. Šafárik University in Košice

Faculty: Faculty of Science

Course ID: ÚFV/ VKTF/04	**Course name:** Selected Topics from Theoretical Physics

Course type, scope and the method:
Course type: Lecture
Recommended course-load (hours):
Per week: 2 **Per study period:** 28
Course method: present

Number of ECTS credits: 4

Recommended semester/trimester of the course: 2.

Course level: III.

Prerequisities:

Conditions for course completion:
Knowledge of the subject at a sufficient level. The credit evaluation of the course takes into account the following student workload: direct teaching and individual consultations (2 credits), self-study (1 credit) and evaluation (1 credit).

Learning outcomes:
The aim is a short renewal of master course and application of quantum field theory in physics of elementary particles and in macroscopic systems with infinite number of degrees of freedom.

Brief outline of the course:
1. Lectures cover wide sphere of problems of high energy physics and statistical physics. Specific applications are carried out for basic theories of elementary particles – Quantum electrodynamics (QED), Quantum Chromodymanics (QCD), standard model (SM) and for some models of unified theory of elementary particles.
2. Application of quantum field theory to the classical physics is concentrated on explanation of connection between the quantum field and statistical fluctuations of classical fields, generating functional of Green functions of quantum fields and statistical sum, on the Feynman graphs and perturbative technique in statistical physics

Recommended literature:

Prerequisities:

Conditions for course completion:
Term project, its presentation, evaluation.
The credit evaluation of the course takes into account the following student workload: direct teaching (1 credit), self-study (1 credit), practical activities - project, tasks (2 credits) and evaluation (1 credit). The minimum limit for completing the course is to obtain at least 51% of the total score.

Learning outcomes:
To introduce the students into the simulation of experiments and to the available programming tools.

Brief outline of the course:
The role of simulation in physics. Probability theory and mathematical statistics. Frequently used distributions in physics. The Monte Carlo methods. Random number generators and their realisations. Programming tools used in high energy physics experiments simulation (e.g. GEANT, PYTHIA).

Prerequisities:

Conditions for course completion:

Learning outcomes:
To review the results of lepton-nucleon collision studies.

Brief outline of the course:
The lectures are concentrated on the analysis of relativistic leptons (electron, positron, and neutrinos) collisions with nucleons (protons and neutrons) and based on these results to study the internal structure of hadrons, mainly that of the proton. Determination of the proton (neutron, pion) structure functions and the extraction of parton structure functions in the proton.To study the photon structure function and analysis of diffractive processes in lepton-nucleon collisions.

Prerequisities:

Conditions for course completion:
Student will make a root macro for data analysis related to the student's research area.
The results will be presented at a final seminar.
Credit distribution:
lectures + consulting: 37 hours - 2 credits
study + preparation for the final seminar: 37 hours - 2 credits

Learning outcomes:
Extending the knowledge of the modern statistical data processing, archivation and visualisation of experimental and theoretical data, basic knowledge of the work with object oriented applications for analysis and data visualisation - ROOT and GRID.

Brief outline of the course:
I. block (1.-9. week):
Selected topics from methods of experimental data analysis in physics, particle physics and from programming of basic physical applications in GRID and ROOT environment.
II. block (10-12.week):
Data analysis in particle physics, data fitting, error propagation, statistical and systematic uncertainties.
