formation of spectra determination of stell macroturbulence is re passing an oral exam, during the course. The direct teaching (2 creations) (1 credit). The minim	be completion: where the course, the student must demonstrate a sufficient understanding of the in stellar atmospheres and their properties. Knowledge of chemical analysis, har radii, temperatures and photospheric pressures, stellar rotation, micro and equired. The condition for obtaining credits is preparation of seminar essay and which consists of three theoretical questions within the curriculum presented the credit evaluation of the course considers the following student workload: dits), self-study (3 credits), individual consultations (2 credits) and assessment num threshold for completing the course is to obtain at least 50% of the total wing rating scale: passed (50-100%), failed (0-49%).
atmospheres. It will independently solve a such as performing of	etures, the student will master important concepts of the physics of stellar also have sufficient physical knowledge and mathematical apparatus to a wide range of astronomical problems related to the analysis of stellar spectra, chemical analysis, determining stellar radii, temperatures and photospheric elocity and micro and macroturbulence parameters.
reference curve of gr The solar chemical c peculiar stars. 2. Stellar radii and te bolometric flux meth flux, the Paschen co metals. 3. Photospheric press gravity-temperature c 4. Stellar rotation: th	ourse: : Curve of growth. Dependence on the temperature, pressure. Saturation. A owth. Derivation of abundances, differential analysis, and synthesis method. omposition, stellar abundances, and their evolutionary changes. Chemically emperatures: speckle photometry, the interferometers, eclipsing binaries, the tod, the surface-brightness method. The effective temperature from absolute ntinuum, colour indices, the Balmer jump, spectral lines of hydrogen and ure: the continuum as a pressure indicator, the spectral lines of hydrogen. The diagram. The helium abundance. e rotation profile, spectroscopic measurements of rotation, Fourier analysis, evolved stars. Rotation and magnetic activity. Rotation of binary stars.

5. Velocity fields in stellar photospheres: Micro-turbulence and macro-turbulence. Line asymmetries. Stellar granulation. Modelling. Stellar wind.

Conditions for course completion:

Literature search and compilation on one particular subject selected. Concluding work.

Credit evaluation of the course: direct teaching,

individual consultations and self-study (1 credit), practical activities – concluding work (2 credits), evaluation (1 credit).

Learning outcomes:

To acquaint with the know edge of selected physical processes in the inner and outer heliosphere.

Brief outline of the course:

1. Introduction. Radial structure of the Sun. 2. Sun atmosphere. Solar flares. Acceleration of particles in eruptions. Solar neutrons and gamma radiation. 3. Solar wind. Interplanetary magnetic field. Corotion interaction areas. 4. Plasma waves in the interplanetary environment. Threedimensional structure of the heliosphere. 5. Active processes in the Sun. Eruptions and outbursts of coronal matter. Shock waves. 6. Solar radio emissions. Thermal emission. Microwave domain. Radio emissions after eruptions and disturbances in the interplanetary environment. 7. Energy particles in the heliosphere. Populations and resources. Solar energy particles. 8. Transport of particles in the interplanetary field. Theoretical foundations. Spatial diffusion. Diffusion in the space of pitch angles. Diffusion in the space of momentum. 9. Interactions of waves and particles in the heliosphere. Transport equations. 10. Observations of particle propagation in the interplanetary environment. Comparison with experiment. 11. Acceleration of particles on shock waves - theoretical models. 12. Particles on shock waves in the interplanetary environment. 13. Galactic cosmic rays and modulation models.

Conditions for course completion:

Literature search and compilation on one particular subject selected. Concluding work.

Credit evaluation of the course: direct teaching,

individual consultations and self-study (1 credit), practical activities – concluding work (2 credits), evaluation (1 credit).

Learning outcomes:

To acquaint with the know edge of selected physical processes in magnetosphere, especially that of Earth.

Brief outline of the course:

1. Particle drifts and the first adiabatic invariant. Guiding center approach. Homogeneous magnetic field. 2. Drifts of zero, first and second order. The first adiabatic invariant. Particle drift at the geomagnetic equator. 3. Oscillating motion between mirror points. Particle capture. Equation of parallel motion with respect to a lineof force. Energy equation. 4. Drift envelopes. The second adiabatic invariant. 5. Drift of particles in a dipole magnetic field. 6. Monitoring of drift envelopes in a real model of a geomagnetic field. 7. Effects of external forces on particles near the equatorial plane. 8. Periodic drift movement. Drift envelopes in a time-dependent magnetic field. 9. Third adiabatic invariant. Influence of ring current on the path of particles near the equator. 10. Effect of sudden compressions and adiabatic expansions of the magnetosphere. 11. Distribution of trapped particles. Directional flow. 12. Distribution functions of particles in the magnetosphere. 13. Mapping of trapped particles in the inner magnetosphere. Coordinates B-L. 14. Disruption of adiabatic invariants. Diffusion mechanisms. 15. Coordinates and distribution functions used. 16. Diffusion equation. Radial diffusion. Angular diffusion in a symmetric field. Combined radial and angular diffusion.

University: P. J. Šafá	rik University in Košice		
Faculty: Faculty of S	Science		
Course ID: ÚFV/ ERS/13	Course name: Exactly Solved Models in Statistical Physics		
Course type, scope a Course type: Lectu Recommended cou Per week: 4 Per stu Course method: dis	re rse-load (hours): ıdy period: 56		
Number of ECTS cr	redits: 8		
Recommended seme	ester/trimester of the course: 4.		
Course level: III.			

Prerequisities:

Conditions for course completion:

The student has to prove sufficient understanding of basic notions, concepts and applications in the field of statistical physics of exactly solvable models in order to successfully complete the present subject. The knowledge of basic terms of statistical physics at the level of their mathematical definition as well as physical meaning is required in addition to concrete applications. The student has to learn the topics in order to be capable of active and creative solving of concrete tasks within the project and pass oral exam. Credit assignment of the subject accounts for the following engagement of the student: lectures (3 credits), independent studies (3 credits), individual consultations (1 credit) and examination (1 credit). The minimal requirement for passing through the subject is to show a good orientation in the curriculum as well as to deeper understand the subject matter. The evaluation scale uses the grades: pass and fail.

Learning outcomes:

After passing lectures the student will have sufficient physical knowledge and mathematical apparatus in order to be capable of independent solving a wide class of traditional as well as state-of-the-art scientific problems of statistical physics. The student will gain overview about diverse applications of statistical physics in the field of magnetism, solid-state physics, atomic and molecular physics.

Brief outline of the course:

1. Exact solution for one-dimensional quantum Ising chain and quantum XY chain in a transverse magnetic field. Jordan-Wigner, Fourier and Bogoliubov transformations. Quantum critical points and anomalous behaviour of quantities in their close vicinity.

2. Exact solution for one-dimensional quantum Heisenberg chain within the framework of secondquantization formalism, the introduction to Bethe ansatz method. Elementary excitation spectrum, free and bound states of the Heisenberg model with two spin deviations.

3. Two-dimensional Ising model: dual transformation, star-triangle transformation, decorationiteration transformation and theory of generalized algebraic transformations. Exact calculation of critical temperatures of ferromagnetic ising models.

4. The formulation of exact solution of a two-dimensional Ising model through the transfer-matrix method. An equivalence of solving a two-dimensional Ising model with dimer covering problem, Pfaffian method.

5. The Ising model as a model of lattice gas, binary alloys, phase separation of liquid mixtures: Frenkel-Louis and Lin-Taylor model.

The selection from aforedescribed topics is made by the supervisor according to scientific orientation of the dissertation thesis.

the basics of high properties of high-e and analysis of X-ra of seminar essay an curriculum presente student workload: credits) and assessr	rse completion: mplete the course, the student must demonstrate sufficient understanding of energy astrophysics. Knowledge of astrophysical mechanisms of origin and nergy radiation in various types of space objects, as well as methods of detection ys and gamma rays is required. The condition for obtaining credits is preparation d passing an oral exam, which consists of three theoretical questions within the ed during the course. The credit evaluation of the course considers the following direct teaching (2 credits), self-study (3 credits), individual consultations (2 nent (1 credit). The minimum threshold for completing the course is to obtain total score, using the following rating scale: passed (50-100%), failed (0-49%).
mechanisms of orig well as methods of physical knowledge	the lectures, the student will master the basic knowledge of astrophysical sin and properties of high-energy radiation in various types of space objects, as detection and analysis of X-rays and gamma rays. It will also have sufficient e and mathematical apparatus to enable independent solving of a wide range of terms related to high energy astrophysics.
and gamma rays, o	course: ophysics: the discovery, properties, and mechanisms for generating of X-rays bserving of high energy photons from cosmic sources. X-ray and gamma ray of cosmic X-ray sources, spectroscopy, timing, significant missions.

2. Solar system X-rays: The production of planetary X-rays, Earth and other planets, the Moon, comets. The interstellar medium: absorption of X-ray by interstellar and intergalactic gas, shadows, scattering of X-ray by interstellar dust.

3. Active stellar coronae: The Sun, the dynamo model, coronal emission from binary systems, high-resolution X-ray spectra, X-ray Doppler imaging, Flare stars, young stars.

4. Early-type stars: O stars, stellar winds, X-rays from single stars, colliding winds, Eta Carinae, Superbubbles.

5. Supernova explosions and their remnants: X-ray from supernovae, evolution of supernovae remnants, young shell-like remnants.

6. Neutron stars and pulsars: The Crab nebula, rotation and spin-down, the glitch, pulsed radiation, structure of neutron stars, cooling, pulsar wind nebulae, anomalous pulsars, soft-gamma repeaters, magnetars.

7. Cataclysmic variable stars (CVs): geometry of accretion in CVs, dwarf nova outbursts, X-rays from dwarf novae, formation and evolution of CVs, magnetic CVs, X-ray spectroscopy of CVs, AM CVn systems, super-soft sources.

8. X-ray binaries: high-mass and low-mass X-ray binaries, black-hole X-ray binaries and their observed properties, soft X-ray transients.

9. Galaxies, active galactic nuclei (AGNs) and clusters of galaxies: X-ray sources in the Milky Way, Local Group, star-burst galaxies, the unified model, and structure of AGNs, central supermassive black holes, jets, out-flowing wings, X-rays from inter cluster medium (ICM), temperature and morphology of ICM, the Sunyaev-Zeldovitch effect.

10. The diffuse X-ray background and Gamma-ray bursts (GRBs): extragalactic source populations and cosmic variance, diffuse galactic emission, discovery, afterglows and precise location of GBRs, present understanding.

which is necessary for homework assignment the study of foreign on it the elaboration participation in lectur experimental data are data of the selected r the results of the anal completion of the exact the student demonstration connections and under incorporation of indivi	e completion: quisition of the subject is required during the course of Magnetochemistry r independent mastery of individual tasks in self-study and in solving specific nts. During the semester, the student will get a theoretical project based or journal literature (understanding of a specific scientific article and based and presentation). Another condition for completing the course is active es and seminars. In the exercises, the student will get a concrete idea of how the analyzed. Subsequently, the student independently analyzes the experimental nagnetic compound in the frame of two to three home projects and presents lysis at a joint meeting. Another condition for obtaining credits is successful um from the theoretical part in the form of an extensive oral discussion, where ates understanding of basic concepts and relationships between them, finding restanding the course as a coherent whole logically built on the basis of gradual ridual interactions. The minimum threshold for passing the course is successful ady projects and individual assignments during the semester and mastering the

final oral exam by more than 50 percent.

Credit evaluation takes into account the scope of direct teaching (2 credits), self-study of recommended literature and preparation of presentation (1 credit) elaboration of home assignments (1 credit), consultations and evaluation (1 credit)

Learning outcomes:

After completing the course, the students will gain a basic perspective, which will allow them to sufficiently orient themselves in the current scientific literature focused on quantum magnetism. Based on the acquired theoretical knowledge and practical experience, they will be able to independently study magneto-structural correlations in electrically non-conductive materials and identify their magnetic state, which is important especially for quantum technologies but also for practical applications such as magnetic cooling especially at low temperatures. Based on the acquired knowledge, discussions and the creation of individual projects, they will also learn the basics of critical thinking in this field.

Brief outline of the course:

1. Development of theories of the structure of atom. Bohr model of atom. Electron in the hydrogen atom. Wave functions and orbitals. Quantum numbers. Magnetomechanical parallelism. Spin of electron. Atoms with higher number of electrons. Electron-electron interactions. Ground state of atom. Hund's rules. Terms. Multiplets.

2. Atom in magnetic field: I. Magnetic properties of atom. Paramagnet. Macroscopic properties of paramagnetic materials. Specific heat – Schottky maximum, experimental techniques of heat capacity measurements. Magnetization - Brillouin function, experimental techniques of magnetization measurements.

3. Atom in magnetic field II: Magnetic susceptibility – Curie law, experimental techniques of susceptibility measurements. Electron paramagnetic resonance. Field induced magnetic moment of filled electronic shells. Diamagnetic susceptibility. Pascal's constants.

4. Atom in crystal field. Weak, medium, strong crystal field. Medium crystal field: Ions with one electron in the unfilled subshell, ions with two and more electrons in the unfilled subshell. Freezing of angular momentum. Jahn-Teller effect.

5. Spin-orbit coupling in the first and second order of perturbation theory. Spin Hamiltonian. Spin Hamiltonian for tetragonal symmetry of the medium crystal field. Kramers theorem. Thermodynamics of the system of paramagnetic ions in crystal field. Specific heat. Magnetization. Magnetic susceptibility. Electron paramagnetic resonance of the systems with crystal field.

6. Magnetic correlations. Exchange coupling. Molecule of hydrogen. Heisenberg Hamiltonian. Exchange pathway. Direct and undirect exchange interaction. Anderson model of superexchange. Goodenough-Kanamori empirical rules.

7. Spatial arrangement of exchange pathways. Cluster. Chain. Layer. Low-dimensional magnetic systems. Three-dimensional magnetic systems. Phase transitions. Correlation length. Ehrenfest's theorems. Long range order. Short-range order. Magnetic dimer: Specific heat. Magnetization. Magnetic susceptibility. Electron paramagnetic resonance.

8. Anisotropy in the exchange interactions. Sources of anisotropy. Dipolar interaction. Heisenberg model. Ising model. XY model.

9. Analysis of the structure of selected compounds based on Ni(II) and Cu(II) ions. Determination of exchange pathways and the influence of crystal field. Suggestion of appropriate magnetic models for the compounds. Using scientific software Origin each student will perform analysis of experimental data of temperature dependence of specific heat of Ni(II) compound, i.e. separation of lattice contribution, calculation of magnetic entropy, comparison with expected theoretical values. 10. Application of theoretical prediction of chosen model for magnetic specific heat of Ni(II) compound and considering the correctness of the model, explanation origin of deviations of experimental data from the applied model .

11. Analysis of magnetic susceptibility of Ni(II) compound-subtraction of diamagnetic contribution, calculation of magnetic moment and g-factor. Application of Curie-Weiss law, then fitting exp. data by a model prediction yielding g-factor and strength of crystal field.

12. Comparison of results obtained from the analysis of specific heat and susceptibility. Then magnetization is calculated and compared with experimental data. Students will make hypothesis about the ground state of the system and they will suggest new experiments on the studied compound.

13. Comparison of the results obtained by individual students which provides information about the influence of individual approach, as number of particular analyses, which test robustness of obtained material parameters etc. Monitoring and examination of elaboration of analogic home projects on Cu(II) compound, accompanied with consultations.

Recommended literature:

2. J-P. Launay, M. Verdaguer, Electrons in Molecules, Oxford 2018.

3. A. Abragam, B. Bleaney, Electron Paramagnetic Resonance of Transition Ions, Oxford, 2012.

Course language:

english

Notes:

The course Magnetochemistry is realized in the attendance form. In some special cases (as was pandemics of Covid) the teaching is realized online using software MS Teams, which enables to keep the contact with students and to keep the level and quality of the course.

Conditions for course completion:

To successfully complete the course, the student must demonstrate a deep understanding of all basic concepts and applications of quantum statistical physics, which is the main theoretical tool for describing the thermodynamic properties of various models of crystalline solids. Based on lectures, which are carried out in the form of block teaching, the student must be able to acquire in detail the methods of theoretical calculations so that he can actively and creatively use the acquired knowledge in solving specific problems during exercises and independent homework. In addition to direct participation in classes, the student is obliged to study within the self-study current research topics assigned by the teacher and also to develop and present in the form of a seminar four home assignments. Mastering the solutions of specific theoretical model systems requires a high degree of independence of students in the study of book and current journal literature. The professional focus of individual home assignments is tied to the syllabus of the course. When studying and developing projects, students can actively consult professional problems with the teacher throughout the semester as needed.

In addition to attending classes, the condition for obtaining credits is the elaboration of home assignments. The minimum limit for passing the exam is to obtain 51% of the total score, which takes into account all required activities with relevant weight.

Learning outcomes:

After completing lectures and exercises, the student will acquire specific knowledge and skills aimed at creating model systems for various crystalline systems. The student will get acquainted in detail with advanced methods of quantum statistical physics enabling the calculation of all relevant physical quantities for various model systems and will be able to competently compare theoretical calculations with experimental data. Specific models for study are determined by the teacher in accordance with the current syllabus of the course.

Brief outline of the course:

Complex theory of solids. Identification of relevant energy contributions to the total energy of the solid and their theoretical description. Static lattice energy, Lenard-Jones and Morse potential of a solid. Vibrational, electron and magnetic contribution to crystal energy and construction of theoretical models within statistical physics. The need to take into account anharmonic effects. Volumetric expansion of the lattice due to temperature and magnetic field. Grüneisen's theory of

anharmonic oscillations of a lattice Anharmonic Debye and Einstein's theory of oscillations of a lattice. Theory of localized magnetic models with distance-dependent exchange interaction. Calculation of relevant thermodynamic quantities for various model systems. Exactly solvable low-dimensional complex models and their thermodynamics.

Conditions for cour To successfully cor	rse completion: nplete the course, the student must demonstrate sufficient understanding of

To successfully complete the course, the student must demonstrate sufficient understanding of the basics of acquisition, processing, and analysis of stellar spectra. Knowledge of different types of spectroscopic instruments and detectors is required, as well as knowledge of the practical determination of the properties of the stellar continuum and spectral lines. The condition for obtaining credits is preparation of seminar essay and passing an oral exam, which consists of three theoretical questions within the curriculum presented during the course. The credit evaluation of the course considers the following student workload: direct teaching (2 credits), self-study (3 credits), individual consultations (2 credits) and assessment (1 credit). The minimum threshold for completing the course is to obtain at least 50% of the total score, using the following rating scale: passed (50-100%), failed (0-49%).

Learning outcomes:

After completing the lectures, the student will master the basics of acquisition, reduction, and analysis of stellar spectra. It will also have sufficient physical knowledge and mathematical apparatus to independently solve a wide range of astronomical problems related to the analysis of stellar spectra, such as determining the properties of the stellar continuum and spectral lines.

Brief outline of the course:

Spectroscopic tools: spectrographs, diffraction and blazed reflection gratings. Shadowing, grating ghosts, satellites, and anomalies. Spectrograph cameras. Echelle spectrographs. Interferometers.
 Detectors: Quantum efficiency and spectral response. Linearity, detector background output, noise, signal to noise ratio, dynamic range and well capacity. Spatial and spectral resolution.

3. The measurement and the behaviour of stellar continua: ultra-low resolution spectrographs and continuum scanners. Absolute calibration, photometric standard stars, measured continua. Continua from photospheric models. Line absorption. A comparison of models to stellar continua. Bolometric flux.

4. The measurement of spectral lines: The coude grating spectrograph, the Richardson image slicer, diffraction grating spectrographs. Instrumental profile, the reconstruction process, noise. The discrete Fourier transform. Measurement of the instrumental profile. Scattered light: measurement and correction.

Conditions for course completion:

Active participation in the Spring School of PhD students of UPJŠ.

Learning outcomes:

By actively participating in the Spring School of PhD Students of UPJŠ, the PhD student demonstrates a high level of ability to process the issues of his dissertation for a multidisciplinary audience with an emphasis on clarifying the motivation, scientific problem, processing methodology and own contribution to the solution of the selected topic. The PhD student demonstrates the ability to professionally discuss various research topics, present his own positions and accept a plurality of opinions. Demonstrates the ability to communicate research results to a wider professional audience with adequate means and through the Slovak language.

Brief outline of the course:

1. Interdisciplinary lectures from the fields of medicine, natural sciences, law, public affairs, humanities. Lecturers - top foreign or national experts from the mentioned fields.

2. Scientific lectures in sections created within related disciplines. Lecturers - top experts from UPJŠ from the mentioned fields.

3. Scientific contributions of PhD students in sections of related fields.

4. Panel discussions on the issue of PhD studies and current trends in the development of scientific disciplines at UPJŠ.
