**Prerequisities:** 

**Conditions for course completion:** 

#### Learning outcomes:

The goal of the course is to teach the students fundamental theoretical and practical aspects of analytical cytometry. The course covers multiple areas of methods in microscopy with special focus on flurescence and its application in confocal microscopy, morphometric measurements and their applications in cytology, determination of vital parameters and live cell imaging, basic methods for sample preparation etc.

#### Brief outline of the course:

1.) Fundamentals of fluorescent methods, principles of fluorescence. 2.) Principles of confocal microscopy 3.) Principles of flow cytometry. 4.) Cell sorting. 5.) Analyses on living cells – principles, hardware requirements. 6.) Methods for vital parameters. 7.) Analyses, imaging methods with regard to lipids, cytoskeleton dynamics or cell division. 8.) Fluorescent dyes and their applications in analytical cytometry. 9.) Staining of nucleic acids, lipids, proteins, cytosceleton stainings, visualization of cell organelles. 10.) Vital stainings. 11.) Membrane transport. 12.) Reactive oxygen and nitrogen species (ROS, NOS). 13.) Mitochodrial membrane potential, pH etc.

#### Course type, scope and the method: Course type: Lecture / Practice

**Recommended course-load (hours): Per week:** 2 / 2 **Per study period:** 28 / 28 **Course method:** present

Number of ECTS credits: 6

**Recommended semester/trimester of the course:** 1.

Course level: II.

Prerequisities:

**Conditions for course completion:** 

Elaboration of semestral thesis.

#### Learning outcomes:

To understand the basic mechanisms of adaptations to environmental factors in animals and humans.

#### Brief outline of the course:

1. Definition of the subject. External environment characteristics. Environmental factors, classification, time factor. Reaction, adaptation, deformation. Classification of adaptations. Stress reaction, general adaptation syndrome.

2. Pathological reaction, pathological state, disease. General characteristics of disease – pain, fever, inflammation.

3. Ageing, theories, physiological changes in ageing. Death of organism. Adaptations to food intake changes and food composition. Food intake regulation.

4. Caloric restriction, starving, increased caloric intake, obesity. Time factor in food intake.

5. Thermoregulation, heat and cold adaptations. Hibernation, diapause.

6. Altitude and hyperbaric adaptations. Osmoregulation.

7. The effects of hypergravity and microgravity, physiological changes during space flight. Sound, ultrasound, infrasound effects.

8. Electromagnetic fields. Effects of electric current. Infrared, visible, ultraviolet radiation and their significance for organisms. Microwaves. Laser.

9. Ionising radiation, classification, sources. The effects of ionising radiation.

10. Xenobiotics, biotransformation. Air, water, and soil pollutants.

11. Drug abuse, mechanism of drug action. The effects of opioids and CNS depressants – sedatives, hypnotics, and alcohol.

12. The effects of CNS stimulants – amphetamines, cocaine, methylxanthines, nicotin. The effects of hallucinogens and solvents.

13. Carcinogenesis, chemical, physical, and biological carcinogens. Oncogenes, tumour suppressor genes. Prevention of carcinogenesis. Prions.

|------------------|--|
| UGM1/03          |  |

Course type, scope and the method: Course type: Lecture / Practice Recommended course-load (hours):

Per week: 2 / 2 Per study period: 28 / 28

**Course method:** present

**Number of ECTS credits:** 6

**Recommended semester/trimester of the course:** 1.

Course level: II.

Prerequisities:

#### **Conditions for course completion:**

Active participation in seminars - elaboration of assignments and protocols for practical exercises completed by continuous assessment (30% of the total assessment), written examinations of the content of lectures (60% of the total assessment), oral exam (10% of the total assessment).

#### Learning outcomes:

To provide the students with the principles of preparation and application of techniques of recombinant DNA.

### **Brief outline of the course:**

Overview of the basic structure and functioning of biomolecules (proteins, nucleic acids), basic concepts and chemical principles applied to biological systems (water as a solvent, buffers, pH), general laboratory techniques (buffer preparation, centrifugation, dialysis, lyophilization).

Enzymes used in gene manipulation (nucleases, restriction endonucleases, lysozyme, proteinases, etc.). Cell lysis methods. Principles of individual isolation units and tasks of individual components, isolation of genomic DNA, methods of plasmid isolation, isolation of DNA from different cell types, isolation and specifics of work with RNA molecules. Electrophoretic techniques (agarose and polyacrylamide, resolution, sensitivity, voltage, color, visualization, different types of electrophoresis. Spectroscopic analysis of biomolecules (general principles, overview of methods and their principle, UV-Vis spectroscopy, MALDI-TOF). and analysis of biomolecules by chromatography.Production of proteins and their purification and characterization (preparation of cell extracts, protein stabilization, precipitation, selection of purification technique by tags) Hybridization methods (Southern, Northern, Western).

#### **Course type, scope and the method: Course type:** Lecture / Practice

Recommended course-load (hours):

Per week: 2 / 2 Per study period: 28 / 28

Course method: present

**Number of ECTS credits:** 5

**Recommended semester/trimester of the course: 2**.

Course level: II., III.

Prerequisities:

#### **Conditions for course completion:**

protocols,

preparation of a project: Model organism for my diploma thesis,

oral examination

#### Learning outcomes:

To provide the students with genetic models of prokaryotic and eukaryotic organisms used in genetic research.

### Brief outline of the course:

Basic properties of model organisms used in genetics. Viral models in genetics (Tobacco mosaic virus, Lambda phage, PhiX174 phage, corona viruses). Prokaryotic model systems (Escherichia coli, Diplococcus pneumoniae, Agrobacterium tumefaciens and A. rhizogenes). Another prokaryotic models (Bacillus subtilis, Caulobacter crescentus, Mycoplasma genitalium, Synechocystis sp.), model systems of simple eukaryotic organisms (Saccharomyces cerevisiae, Neurospora crassa, Aspergillus nidulans, Dictiostelium discoideum). Animal model systems (Drosophila melanogaster, Caenorhabditis elegans, Danio rerio, Mus musculus). Another animal models (Xenopus laevis, Ambystoma mexicanum, Chrysemys picta, Anolis carolinensis, Fugu rubripes, Gallus gallus, Heterocephalus glaber). Plant model organisms (Pisum sativum, Arabidopsis thaliana, Nicotiana tabacum, Zea mays, Selaginella moellendorffii, Brachypodium distachyon, Lotus japonicus, Populus trichocarpa). Genetic databases. Model organisms and their importance in the study of fundamentals of human genetic disorders.

|------------------|---|
| MZO1/03          |   |

Course type, scope and the method: Course type: Lecture Recommended course-load (hours): Per week: 2 Per study period: 28 Course method: present

Number of ECTS credits: 3

**Recommended semester/trimester of the course:** 1.

Course level: II.

Prerequisities:

#### **Conditions for course completion:**

written examination (pass three tests)

#### Learning outcomes:

Acquiring of basic knowledge about molecular and regulatory mechanisms of ontogenetic development of multicellular organisms (animal and plant organisms).

#### Brief outline of the course:

Molecular and regulatory basis of ontogenesis:

1) Totipotency of zygote and genomic equivalence as general pre-requisite for ontogenetic development. Cell adhesion and migration, positional information, developmental signals and morfogens. 2) Induction, determination and differentiation. Selective gene expression, combinatory control of gene expression, lateral inhibition. 3) Mechanisms of epigenetic memory. DNA methylation, genomic imprinting, X-chromosome inactivation. Morphogenesis (asymmetry and polarity of cells, reorganization of cytoskeleton, embryonic folding and flexion). 4) Genes controllig development (selector genes, regulators and super-regulators, homeotic genes). Programmed cell death (apoptosis autophagy). 5) 1st test.

Ontogenetic development of drosophila:

6) Oogenesis. Specification and polarization of oocyte, determination of oocyte axes. Fertilization, cleavage and early embryogenesis. 7) Early embryo polarization and determination of embryo axes. Specification of body segments, segmentation genes. 8) Gastrulation (germ layers formation, neurulation). Morphogenesis and cell rearrangements. Development of some organs and organ systems. Pupation and metamorphosis. 9) 2nd test.

Ontogenetic development of mammals:

10) Fertilization. Cleavage and early embryogenesis (blastulation, gastrulation, neurulation). 11) Early embryo polarization and determination of embryo axes. Induction of primitive streak and germ layers formation. Specification and development of CNS. Somitogenesis, myogenesis. 12) Development of some organs and organ systems. 13) 3rd test.

#### **Course type, scope and the method: Course type:** Lecture / Practice

Recommended course-load (hours):

Per week: 2 / 2 Per study period: 28 / 28

**Course method:** present

### Number of ECTS credits: 5

## Recommended semester/trimester of the course: 2.

Course level: I., II.

Prerequisities:

## **Conditions for course completion:**

1. compulsory participation on Anatomy lectures and exercises, max. 3 absences per semester. If the number of absences exceeds three, every other absence results in the loss of one point from the earned points.

2. one written exam (max. 50 points) during semester

3. written exam (test, 50 points max.) during summer exam period. Final grade will be calculated based on the total sum of earned points from written exam (50 points) and test (50 points). Grading scale: A (100-91 points), B (90.5-81), C (80.5-71), D (70.5-61), E (60.5-51), FX (50.5 and less)

### Learning outcomes:

After successful completion of the lectures, student masters the knowledge on anatomy and organization of central and peripheral nervous system. Student understands the particular functions of nervous system in homeostasis, sensory perception, motor functions, as well as in processing of signal at various levels of nervous system. Successful completion of the lectures prepare students for further study of various psychological disciplines.

### Brief outline of the course:

1. introduction to neuroanatomy, basic principles of functional neuroanatomy, classification of the nervous system, dividing of the Nervous System (CNS, PNS, autonomous NS, somatic NS),

- 2. the spinal cord and nervous tracts
- 3. the brainstem: medulla oblongata, pons, mesencephalon
- 4. peripheral nervous system: spinal and cranial nerves
- 5. the cerebellum
- 6. the diencephalon
- 7. the telencephalon, cerebral cortex (paleopallium, archipallium, neopallium) and basal ganglia
- 8. ventricular system of the brain, meninges and blood supply,
- 9. autonomic nervous system: symphatetic and parasymphathetic
- 10. functional systems I: motor systems
- 11. functional systems II: sensory systems, perception
- 12. functional systems III: limbic system, emotions, memory
- 13. functional systems IV: higher cognitive functions, motivation

# Definition and history of plant biotechnology. Aseptic techniques, culture conditions. Micropropagation, types of plant explant cultures used in biotechnology. Somatic hybridization and embryogenesis, direct and indirect organogenesis. Somaclonal varation. Secondary metabolites production, bioreactors, biotransformation, immobilization and elicitation. Genetic transformation, direct and indirect methods of transformation. Types of vectors, promotors, selection markers and reporter genes used in plant transformation. Germplasm storage, gene banks. Cryopreservation and slow growth method. Genetically modified organisms - metabolic engineering, genetic engineering, plants resistant to biotic and abiotic stresses, molecular farming, the role of tissue and organ specific plant promoters, plastome engineering, plant-based edible vaccines. RNA silencing, the application of microRNAs in plant biotechnology.

| and its importance for<br>methods of taxonomia<br>a way of verifying the<br>but also to apply it to                | taxonomy is a basic subject for understanding modern systematics of plants<br>or the study of various taxonomic groups, the student is oriented in the used<br>c work and their evaluation, is able to create taxonomic hypotheses and design<br>nese hypotheses. He is able to use the knowledge in basic botanical research,<br>solving problems in plant breeding, in agricultural practice, in the evaluation<br>t protection and biodiversity preservation. |
| Information sources<br>cytology, karyology,<br>2. Determination of ta<br>3. Approaches to bi<br>"Angiosperm Phylog | nts. The importance of classification and the problems associated with it.<br>and taxonomic data. Morphology and anatomy, embryology, palynology,<br>ecology, phytogeography.<br>axonomic relationships.<br>iological classification. Examples of past and present plant systems. The<br>geny Group IV" system.<br>s and its study. Early works on plant variability. Multivariate data in taxonomy  |

5. The size of the plant genome and approaches to its study. Flow cytometry. Angiosperm genome size evolution.

6. Parallel and convergent evolution. Examples: parasitism, insectivory and C4-metabolism.

7. Basic principles of cladistics.

8. Cladistic studies - revealing the branches of evolution.

9. Principles of molecular systematics of plants.

10. Basics of botanical nomenclature. International code of nomenclature of algae, fungi and plants.

11. Taxonomic publications and examples of taxonomic studies I. Examples from the genus Viola.

12. Taxonomic publications and examples of taxonomic studies II. Examples from the genus Onosma.

Exercises (they take place in blocks):

1. Introduction to plant taxonomy exercises. Herbarium documents and their meaning.

2. Fieldwork in botany, collection of samples, processing of plant material, practical demonstrations.

3.- 4. Palynological methods. Collection and preparation of samples, observation of preparations and their evaluation.

5.- 6. Karyological methods in plant taxonomy. Sampling, preparation of specimens, observation and evaluation of specimens.

7.- 8. Phenetic data analysis – examples and demonstrations of plant material processing, multivariate data analysis, clustering and ordination methods.

9.- 10. Use of flow cytometry in plant taxonomy. Determination of the degree of ploidy and the size of the plant genome. Determination of reproductive method of plants - FCSS (flow cytometric seed screen).

11.-12. Molecular systematics of plants. Parsimony analysis of DNA sequences, phenetic analysis of AFLP DNA fragments - examples and demonstrations.

13. Basics of botanical nomenclature. International code of nomenclature of algae, fungi and plants. Practical tasks.

#### Learning outcomes:

The main goal of the subject is to get knowledge on the basic reasons of recent distribution of the animals on the Earth, zoogeographic regionalization of the Earth's surface and human influence on the faunal distribution in the history.

#### Brief outline of the course:

This course will review our current understanding of the patterns of animal distribution and the processes that influence distributions of species and their attributes. Zoogeography will integrate information on the historical and current ecology, genetics, and physiology of animals and their interaction with environmental processes (continental drift, climate) in regulating geographic distributions. The course will emphasize descriptive and analytical approaches useful in hypothesis testing in zoogeography and will illustrate applied aspects of zoogeography (e.g. refuge design in conservation).
