### **Conditions for course completion:**

The evaluation is based on continuous assessment during the semester using a questionaire and task assignments. The credits will be awarded to a student who is successful in each evaluation segment at 60% success rate.

### Learning outcomes:

Knowledge: The student will get the overview on basic principles of publishing scientific results including ethical aspects and protection of authorship rights. He/she will have the overview of scientific journals in his/her specialization and is familiar with the review process. He/she knows major domestic and foreign funding agencies and programes.

Skills: The student will gain the ability to publish the results of his/her research results independently or within the team, in a foreign langage, in a position of the main/corresponding author strictly adhering to ethical principles and rules. He/she is able to formulate the research problem and prepare a research grant proposal.

Competencies: The student is able to publish independently or within the team the results of own research in a respected international peer-reviewed journal while adhering to ethical principles and rules. He/she is able to apply for research funding.

### Brief outline of the course:

Organizational aspects and methodology of research. Information resources. Writing the research paper. Authorship, rights and protection. Plagiarism and predatory journals. Ethical aspects of research work. Funding agencies and programes. Grant proposal. Presentation of research results – publication, oral presentation, poster.

| The PhD student demonstrates the ability to participate in teamwork, to bring his own contribution to the solution of the project objective of applied research and to take responsibility for assigned tasks. By solving an applied research project, he acquires the ability to implement the project objective according to the established procedure, to follow the project schedule, to coordinate his own activities with colleagues, to participate in the creation of applied research outputs. The PhD student gains valuable experience from the practical course of a grant project with a focus on applied research. |  |     |  |

Students are awarded with the credits in the final assessment if<br>the level of mark E or better.  |  |
| Learning outcomes:<br>Knowledge: Knowled<br>of georelief (digital e<br>and methodological<br>parameters and their<br>georelief, relative her<br>the relief). Furthermon<br>georelief, including (<br>and their orders, hier<br>Skills: Mastering met<br>parameters and ident<br>relief modeling and<br>processing of georeli<br>Competences: The ab<br>models and the calc<br>appropriately visualization | Ige of data collection and processing methods for the creation of digital models<br>levation models, DEM) or canopy surface (DSM); about the basic theoretical<br>principles of geomorphometry, including the derivation of morphometric<br>applications in practice (especially the slope, orientation and curvature of the<br>ight, depth and length of the slopes, horizontal and vertical fragmentation of<br>ore, knowledge of the analysis of the spatial and hierarchical structure of the<br>derivation of important lines such as valleys, falls, distribution points, pools<br>archy of forms, base and residual surfaces, elementary relief forms).<br>thods of creating digital relief models, methods of deriving geomorphometric<br>diffication of georelief forms. The use of different interpolation methods for<br>in the evaluation of the quality of interpolation and models. Time series<br>ef models in the form of a space-time cube in GIS.<br>bility to appropriately choose a procedure for the derivation of digital georelief<br>ulation of basic and specific geomorphometric parameters. The ability to<br>ze the outputs of geomorphometric analyzes in the form of static and dynamic<br>n. |  |
| Brief outline of the c<br>1. Geomorphometry<br>methodological princ<br>2. Digital relief mod<br>creating relief models  | <b>ourse:</b><br>, and its definition, the meaning of geomorphometry and its basic<br>tiples.<br>els based on triangular networks and a raster data model. Data sources for<br>s.   |  |

3. Evaluation of interpolation quality and statistical indicators and error propagation in relief modeling.

4. Hierarchical levels of georelief (spatial, temporal) and their reflection in geomorphometry methodology.

5. Expressing the relationship between the geometric structure of the georelief and processes modeling the georelief.

6. Basic morphometric parameters - definition and meaning: slope of the georelief in the direction of gradient curves, orientation of the georelief with respect to the cardinal points, curvature of the georelief, overall geometric forms of the georelief and their classification based on ordered pairs of normal curvatures.

7. Identification and analysis of profiles, important lines and points on the georelief, hypsometric map, relative heights, depth and length of slopes, horizontal and vertical fragmentation, roughness 8. DEM segmentation, identification of georelief forms or land cover objects.

9. Creation of various applied morphometric maps.

| Learning outcomes:<br>Knowledge: Theoreti<br>(GNSS) and remote s<br>in geoscience researc<br>information on GNS<br>multispectral images<br>purpose of targeting<br>own reference station | ical knowledge from selected chapters of global navigation satellite systems<br>sensing of the Earth, overview of current GNSS technology and RS methods<br>ch. Knowledge of important and relevant journal publications and sources of<br>S and RS contemporary issues . Overview in methods of classification of<br>and lidar data. Skills: Ability to operate a GNSS geodetic receiver for the<br>control points or determining the location of objects in the country with its<br>and using the SKPOS network. Processing of multispectral data performing |  |

image classification, its validation. Ability to process cloud of points from aerial photometrametry. Competencies: Ability to find suitable GNSS methods for mapping and locating objects in the country. Furthermore, the ability to appropriately use RS methods and the data obtained by them according to the purpose of use in geographic applications and to validate the obtained results.

### Brief outline of the course:

The latest trends in the use of GNSS in geographic research. High-precision position measurements using RTK - principles and applications. Use of GNSS in the research of processes in the country. Hyperspectral data processing, landscape feature analysis, change detection. Methods of classification of image records. Global and regional spatial databases derived by DPZ methods. New trends in the RS. Collection and processing of data from satellite multispectral scanning, data processing from aerial laser scanning, filtering and classification of lidar points and creation of 3D landscape models. Methods of recording landscape dynamics using RS.

| The grading is based on continuous control during the semester in the form of control questions and tasks for independent work. In addition to lectures, the course also includes self-study of recommended literature and consultations. To get credits, the student has to who achieve at least 50% (grade E) of evaluation during the semester. |   |
| Learning outcomes:<br>Knowledge: Student<br>related geoscience r<br>geographic informat<br>Skills: The students of<br>using selected meth<br>create time series cha<br>and dynamics of cha<br>suitable open source<br>use social and econo<br>anthropogenic comp   | is demonstrate a thorough understanding of selected theoretical concepts and<br>esearch methods related, with a focus on methods that can be applied using<br>ion systems.<br>can digitally process and analyse the features and components of the landscape<br>ods, for example, special methods of field research, landscape monitoring<br>aracterizing the development of state variables in order to analyse the structure<br>anges in the landscape. Students can collect relevant field data, apply it to a<br>e GIS, analyse and correctly interpret the results. Students can innovatively<br>pomic data and quantitative methods used in human geography to analyse the<br>ponents of the landscape and their changes over time, to formulate research |

### **Brief outline of the course:**

Methods of research of the natural component of the landscape.

Selected methods of field research of the landscape and monitoring.

Geoecological research.

Mapping and identification of landscape changes using selected geospatial technologies.

based on their outputs, logically and consistently draw scientifically relevant conclusions.

Analysis of the spatio-temporal structure of the region.

Qualitative and quantitative methods in human geography.

Formulation of research hypotheses, application of statistical methods.

Modeling and forecasting in human geography.

### Learning outcomes:

Knowledge: The student will have the overview on astronomical, terrestrial and orbital coordinate systems with a focus on global and local coordinate systems for Geoinformatics.

Skills: The student will have the ability to make coordinate systems transformations used in current GIS especially using available open-source tools (PROJ library).

Competencies: The student will be able to formulate independently or within the team the requirements on coordinate systems definitions used in GIS projects and propose appropriate software tools for effective and accurate coordinate system transformation for various geospatial data.

### Brief outline of the course:

Coordinate systems and their classification. Terrestrial coordinate systems: geocentric and topocentric coordinate systems. Astronomic coordinate systems: geocentric and ecliptical coordinate systems. Orbital coordinate systems: geocentric coordinate systems depending on time. Geodetic coordinate systems and their specifities in collection methods for Geoinformatics and GIS. Current coordinate systems developed by IRES. Specific transformation methods between selected coordinate systems. National coordinate system in Slovakia - SKPOS (Slovenská priestorová observačná služba) and SLOVGERENET (Slovak Geodynamic Reference Network) and their use for Geoinformatics. Coordinate systems used in GIS, thier transformations and available software tools including the PROJ library.

#### **Conditions for course completion:**

The subject consists of direct teaching, practical activities, self-study and individual consultations. Direct teaching takes place in the Remote Sensing Laboratory, at home institution. Available unmanned aerial systems and accessories, as well as data processing software, are introduced during a lectures. This part makes up 20% of the total teaching. The aim of the course is to teach students to use advanced methods of mapping and data processing using unmanned aerial systems in a selected location of interest. All activities will be performed under the supervision of an authorized person to perform aerial works. The portion for implementation of practical activities in the field is 40% and another 30% is self-study based on professional literature. 10% of teaching consists of individual consultations. The student completes the course if he presents the results obtained from his own measurements. The presentation also includes a discussion with professional literature.

#### Learning outcomes:

Knowledge: The student will gain advanced knowledge of UAS and sensors for mapping and can identify their potential in geoscience research.

Skills: Under the supervision of a responsible person, the student will perform mapping using unmanned aerial systems and use advanced data processing methods in specialized software. Competences: The student is able to independently propose a methodology for data collection from UAS, use advanced data processing methods and compare the results with the results of other authors published in scientific journals.

#### Brief outline of the course:

Categories of unmanned aerial vehicles, technical characteristics and areas of application for landscape mapping. Technology platforms and UAV equipment. Management and control systems. Mission planning and mapping. Data processing. Software for processing photographic records and creating 3D models. Aerial laser scanning using UAV. Laser scanning data processing. Applications in geographic research. Legislative framework for the use of UAVs in Slovakia and abroad

| <b>Learning outcomes:</b><br>To acquaint students with interdisciplinary approaches to solving geostatistical problems based<br>on statistical physics models. Students will get acquainted with methods of predicting spatially-<br>correlated data based on so-called spin models, standardly used in magnetism.  |  |       |
| Brief outline of the course:<br>Geostatistical problems solved by innovative approach, an alternative to conventional geostatistical<br>methods, based on models from statistical physics. Getting familiar with the basic concepts of<br>statistical physics and their application to the physical lattice spin models. Geostatistical data<br>modeled as correlated spatial random fields defined through local interactions - an analogy with<br>statistical-physical spin models. Demonstrating the effectiveness and universality of defined models<br>in the processing of bulky, for example, satellite or radar datasets. |  |       |

| <b>Conditions for cours</b><br>Principal investigator  | se completion:<br>r of an internal grant (VVGS                         | 5)  |  |  |
| The PhD student demonstrates the ability to process a successful application for his own research problem within the internal grant system at UPJŠ. Acquires skills with the design of research stages, their time schedule, measurable outputs and adequate distribution of funds. The very solution of the internal VVGS grant acquires the ability to implement the project intention according to the established procedure, to be responsible for achieving the set outputs. As a responsible researcher, the PhD student acquires competencies in project management, its administration, and presentation of results. |  |     |  |  |

Prerequisities:

#### **Conditions for course completion:**

The evaluation is based on continuous assessment during the semester using a questionaire and task assignments. The credits will be awarded to a student who is successful in each evaluation segment at 60% success rate.

#### Learning outcomes:

Knowledge: The student will get the overview on current approaches in software modules programming for GIS, especially open-source (GRASS GIS, QGIS) using programing languages such as ANSI C and Python. He/she will have the overview on licencing and approaches in the development of open-source softwares.

Skills: The student will gain the ability to install the software from the source code in Linux operating system including necessary libraries and software modules. He/she will be able to understand the source code in ANSI C and Python and make the modifications of the code to change the functionality of the software module including its installation in the system.

Competencies: The student will be able to work independently or within the team to develop the GIS software, i.e. create and compile GIS software modules, install GIS software and necessary software libraries from the source code (e.g., GDAL, PROJ and other) in Linux operating system.

#### Brief outline of the course:

Legislative framework and licencing. Principles and approaches for programming for GIS. Comparison of GIS softwares using programming languages and licencing. Levels of module integration in GIS. Software architectures, source code structure, libraries. Installation and compilation in Linux operating system. Examples of implementation in ANSI C, Shellscript and Python. Examples of ready-to-use modules for GRASS GIS. Project of software module development.

| The grading is based<br>and tasks for an inc<br>recommended literati<br>grade of at least E (50   | on continuous control during the semester in the form of control questions<br>lependent work. In addition to lectures, the course includes self-study of<br>ure and consultations. Credits will be awarded to a student who achieves a<br>0%) in the final assessment.   |  |
| Learning outcomes:<br>Knowledge: The student knows the applications of remote sensing data in the research of the geological bedrock, changes in lithology often indicating the presence of mineral resources, tectonic geological structures, as well as the possibilities of verification of remote sensing data in the field. Skills: The student can identify the basic elements of the geological structure of the territory resulting from the changes in the morphological characteristics of the terrain, the drainage network, the resistance of rocks to weathering, layering and specific spectral characteristics of individual genetic rock types (e.g., alterations), selected types of mineral resources, structures such as the folds, faults, shear zones and lineaments based on remote sensing data. Competences: The student is able to define a specific geological problem that he wants to analyse using remote sensing methods, he can design a suitable methodological procedure for analysis and synthesis, and he can communicate the results of his research. |  |  |

Prerequisities:

#### **Conditions for course completion:**

The evaluation is based on continuous assessment during the semester using a questionaire and task assignments. The credits will be awarded to a student who is successful in each evaluation segment at 60% success rate.

#### Learning outcomes:

Knowledge: The student will have the overview on metascience and interdisciplinary aspects of geoinformatics as well as further development in this field of science. Based on the current knowledge and paradigms in this field, he/she will acquire a deep understanding of theoretical aspects in geoinformatics and geographic information systems with cutting-edge knowledge, methods and applications using self-study activities, literature review and managed scientific discussions.

Skills: The student will gain the ability to analyze scientific problem, determine the theoretical framework and formulate concrete methodological steps for a solution using the newest scientific knowledge. He/she is able to present the proposed solution in a discussion of experts and in comparison with other, alternative solutions.

Competencies: The student is able to participate independently or within the team on research activities while exhibiting independent and critical thinking based on deep knowledge of the problem, literature and own research. He/she is able of critical thinking and evaluation of own research results or other researchers and formulate further steps, solutions including various alternatives.

#### Brief outline of the course:

Metageographic aspects of Geoinformatics as an independent field of science. Theoretical and methodological tools of Geoinformatics in solution problems of landscape. Geoinformatics literature. Analysis of current publications (monographs, papers). Critical analysis of scientific works, interpretation and formulation of conclusions. Formulation of a research problem and methodological steps, selection of methods, data and tools. New methods for geospatial adata collection and their influence on methods of processing in GIS, specifics of natural and human phenomena modeling in GIS. Mathematical and numerical methods. The influence of technological component of infrastructure on the development of new geospatial methods. Communication and publication in a network environment. Summary of the latest trends in the Geoinformatics research.
