Faculty: Faculty of Science

Course ID: ÚBEV/	Course name: Animal and Human Ecophysiology
EFZ1/03	

#### Course type, scope and the method: Course type: Lecture / Practice

**Recommended course-load (hours): Per week:** 2 / 2 **Per study period:** 28 / 28 **Course method:** present

Number of ECTS credits: 6

**Recommended semester/trimester of the course:** 1.

Course level: II.

Prerequisities:

**Conditions for course completion:** 

Elaboration of semestral thesis.

#### Learning outcomes:

To understand the basic mechanisms of adaptations to environmental factors in animals and humans.

#### Brief outline of the course:

1. Definition of the subject. External environment characteristics. Environmental factors, classification, time factor. Reaction, adaptation, deformation. Classification of adaptations. Stress reaction, general adaptation syndrome.

2. Pathological reaction, pathological state, disease. General characteristics of disease – pain, fever, inflammation.

3. Ageing, theories, physiological changes in ageing. Death of organism. Adaptations to food intake changes and food composition. Food intake regulation.

4. Caloric restriction, starving, increased caloric intake, obesity. Time factor in food intake.

5. Thermoregulation, heat and cold adaptations. Hibernation, diapause.

6. Altitude and hyperbaric adaptations. Osmoregulation.

7. The effects of hypergravity and microgravity, physiological changes during space flight. Sound, ultrasound, infrasound effects.

8. Electromagnetic fields. Effects of electric current. Infrared, visible, ultraviolet radiation and their significance for organisms. Microwaves. Laser.

9. Ionising radiation, classification, sources. The effects of ionising radiation.

10. Xenobiotics, biotransformation. Air, water, and soil pollutants.

11. Drug abuse, mechanism of drug action. The effects of opioids and CNS depressants – sedatives, hypnotics, and alcohol.

12. The effects of CNS stimulants – amphetamines, cocaine, methylxanthines, nicotin. The effects of hallucinogens and solvents.

13. Carcinogenesis, chemical, physical, and biological carcinogens. Oncogenes, tumour suppressor genes. Prevention of carcinogenesis. Prions.

<b>Brief outline of the course:</b> The aim of the subject is to introduce the methods of molecular biology as the tools used to so problems of zoological, ecological and physiological studies, in both theoretical but first of al practical form. The course focuses on basic molecular methods used in studies of taxonomy, ecology a physiology of animals (invertebrates and vertebrates). The main task is to provide not o theoretical knowledge, but in the form of practical exercises, mainly skills usable in practice (especially in the solution of future bachelor and master theses).	l in and nly

neurons (membrane	the principles of nervous system functioning from the level of individual potential, action potential, synaptic transmission), through simple neural to the description of complex functional parts of the nervous system (brain al nervous system).

- 1. Neurophysiology as a part of neurosciences
- 2. Nervous system basic structures and functions (CNS, PNS).
- 3. Neuron as a basic functional unit of the nervous system structure, function, structural and functional classification
- 4. Glial cells role and functional classification
- 5. Electrochemical basis of membrane potential; ion channels, ion currents
- 6. Origin and propagation of action potential, phases, parameters and types of action potential. Nerve fibers, myelin, rate of propagation of arousal, etc....

7. Principle of synapse, chemical and electrical synapse, synaptic excitation and inhibition. Synaptic potentials, temporal and spatial summation, excitation threshold.

- 8. Neurotransmitters and receptors. Receptor classification, mechanism of action.
- 9. Spinal cord basic structures and functions. Spinal reflexes. Basic sensory and motor pathways in the spinal cord.
- 10. Brain basic parts, their origin and function.
- 11. Neurophysiology of the senses sight, hearing, smell, taste and touch.
- 12. Peripheral nervous system. Autonomic nervous system sympathetic and parasympathetic.
- 13. Bioelectrical manifestations of the nervous system. Clinical and experimental research methods.

Course ID: ÚBEV/ PRY/25Course name: Fish parasites
Course type, scope and the method: Course type: Lecture / Practice Recommended course-load (hours): Per week: 2 / 2 Per study period: 28 / 28 Course method: distance, present
Number of ECTS credits: 5
Recommended semester/trimester of the course: 2., 4.
Course level: II., III.
Prerequisities:
Conditions for course completion: active participation in practical exercises, presentation of seminar work, continuous written examinations, oral examination
Learning outcomes: After completing the course Fish parasites students will demonstrate: - knowledge of diagnostic methods commonly used in fish parasitology - practical use of methods commonly used in fish parasitology - evaluate the method of detection and identification on the basis of knowledge of fish parasite life cycles
<b>Brief outline of the course:</b> The course focuses on the taxonomy, morphology, physiology, and behavioral manifestations, life cycles, and ecological requirements of selected groups of parasitic organisms of freshwater fish. It explores adaptations to a parasitic lifestyle in both unicellular and multicellular parasites, parasite-host interactions, and the mutual influence on the population dynamics of both parasites and hosts, host specificity, co-evolution with the host, the socio-economic impact of parasitic diseases, and the influence of humans and aquaculture.

Faculty: Faculty of Science

Course ID: ÚBEV/	Course name: Molecular Basis of Ontogenetic Development
MZO1/03	

Course type, scope and the method: Course type: Lecture Recommended course-load (hours): Per week: 2 Per study period: 28

Course method: present

Number of ECTS credits: 3

**Recommended semester/trimester of the course:** 

Course level: II.

Prerequisities:

#### **Conditions for course completion:**

written examination (pass three tests)

#### Learning outcomes:

Acquiring of basic knowledge about molecular and regulatory mechanisms of ontogenetic development of multicellular organisms (animal and plant organisms).

#### Brief outline of the course:

Molecular and regulatory basis of ontogenesis:

1) Totipotency of zygote and genomic equivalence as general pre-requisite for ontogenetic development. Cell adhesion and migration, positional information, developmental signals and morfogens. 2) Induction, determination and differentiation. Selective gene expression, combinatory control of gene expression, lateral inhibition. 3) Mechanisms of epigenetic memory. DNA methylation, genomic imprinting, X-chromosome inactivation. Morphogenesis (asymmetry and polarity of cells, reorganization of cytoskeleton, embryonic folding and flexion). 4) Genes controllig development (selector genes, regulators and super-regulators, homeotic genes). Programmed cell death (apoptosis autophagy). 5) 1st test.

Ontogenetic development of drosophila:

6) Oogenesis. Specification and polarization of oocyte, determination of oocyte axes. Fertilization, cleavage and early embryogenesis. 7) Early embryo polarization and determination of embryo axes. Specification of body segments, segmentation genes. 8) Gastrulation (germ layers formation, neurulation). Morphogenesis and cell rearrangements. Development of some organs and organ systems. Pupation and metamorphosis. 9) 2nd test.

Ontogenetic development of mammals:

10) Fertilization. Cleavage and early embryogenesis (blastulation, gastrulation, neurulation). 11) Early embryo polarization and determination of embryo axes. Induction of primitive streak and germ layers formation. Specification and development of CNS. Somitogenesis, myogenesis. 12) Development of some organs and organ systems. 13) 3rd test.

<b>Course ID:</b> ÚBEV/	Course name: Neuroanatomy
NATM/15	

#### **Course type, scope and the method: Course type:** Lecture / Practice

Recommended course-load (hours):

Per week: 2 / 2 Per study period: 28 / 28

Course method: present

#### **Number of ECTS credits:** 5

#### **Recommended semester/trimester of the course: 2**.

Course level: I., II.

Prerequisities:

#### **Conditions for course completion:**

1. compulsory participation on Anatomy lectures and exercises, max. 3 absences per semester. If the number of absences exceeds three, every other absence results in the loss of one point from the earned points.

2. one written exam (max. 50 points) during semester

3. written exam (test, 50 points max.) during summer exam period. Final grade will be calculated based on the total sum of earned points from written exam (50 points) and test (50 points). Grading scale: A (100-91 points), B (90.5-81), C (80.5-71), D (70.5-61), E (60.5-51), FX (50.5 and less)

#### Learning outcomes:

After successful completion of the lectures, student masters the knowledge on anatomy and organization of central and peripheral nervous system. Student understands the particular functions of nervous system in homeostasis, sensory perception, motor functions, as well as in processing of signal at various levels of nervous system. Successful completion of the lectures prepare students for further study of various psychological disciplines.

#### **Brief outline of the course:**

1. introduction to neuroanatomy, basic principles of functional neuroanatomy, classification of the nervous system, dividing of the Nervous System (CNS, PNS, autonomous NS, somatic NS),

- 2. the spinal cord and nervous tracts
- 3. the brainstem: medulla oblongata, pons, mesencephalon
- 4. peripheral nervous system: spinal and cranial nerves
- 5. the cerebellum
- 6. the diencephalon
- 7. the telencephalon, cerebral cortex (paleopallium, archipallium, neopallium) and basal ganglia
- 8. ventricular system of the brain, meninges and blood supply,
- 9. autonomic nervous system: symphatetic and parasymphathetic
- 10. functional systems I: motor systems
- 11. functional systems II: sensory systems, perception
- 12. functional systems III: limbic system, emotions, memory
- 13. functional systems IV: higher cognitive functions, motivation

The main goal of the subject is to get knowledge on the basic reasons of recent distribution of the animals on the Earth, zoogeographic regionalization of the Earth's surface and human influence on the faunal distribution in the history.

# Brief outline of the course:

This course will review our current understanding of the patterns of animal distribution and the processes that influence distributions of species and their attributes. Zoogeography will integrate information on the historical and current ecology, genetics, and physiology of animals and their interaction with environmental processes (continental drift, climate) in regulating geographic distributions. The course will emphasize descriptive and analytical approaches useful in hypothesis testing in zoogeography and will illustrate applied aspects of zoogeography (e.g. refuge design in conservation).
